Overview Steps Validation FAQs

Azure Administrator Associate

Lab Steps

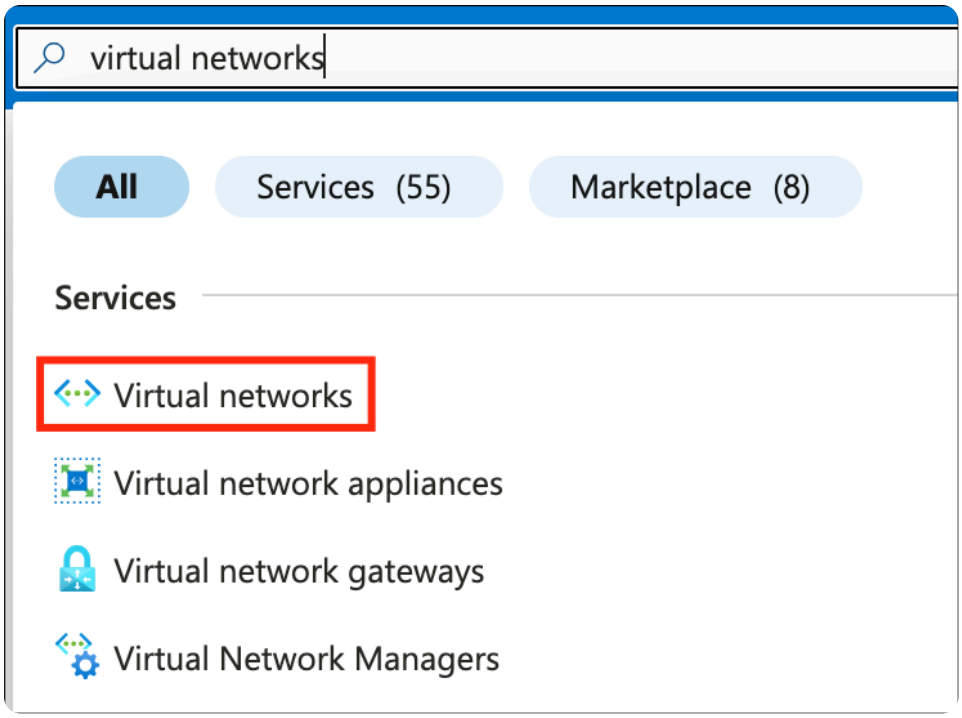

Task 1: Sign in to Azure Portal

1. Go to the Azure portal by clicking on the **Open Console** button or by using URL https://portal.azure.com.
   - **Note**: It is recommended to use incognito mode to avoid Azure portal cache related issues.
2. If it automatically logs into any other azure account, please logout of it and clear cache.
3. Sign in with your given ***username*** and ***password*** on Azure portal.
4. If login is not working. Click on **End Lab** and start the lab again.

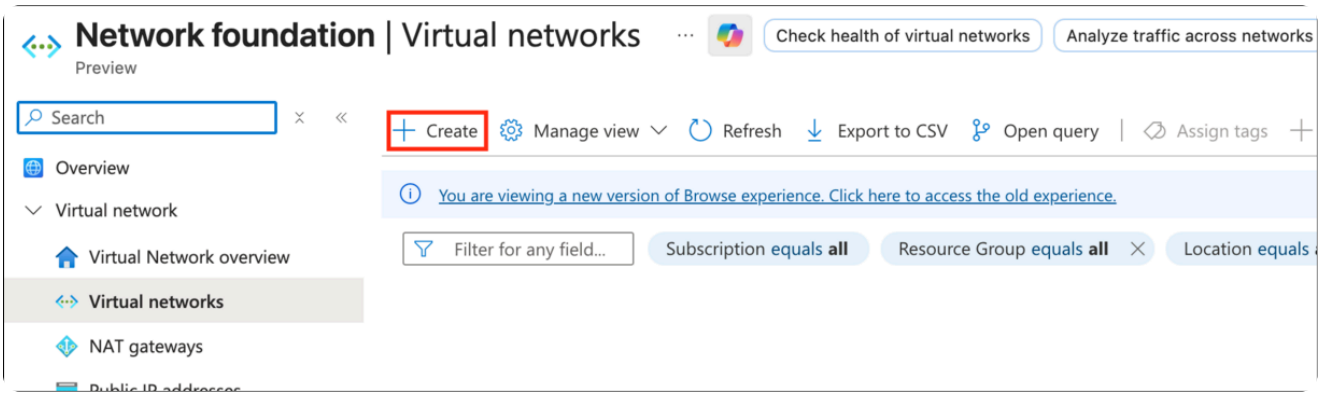

Task 2: Create a Virtual Network

In this task, we will create Virtual Network on Azure Portal.

1. At the top of the Azure portal, in the search box, enter **Virtual network**. Select **Virtual Networks** in the search results.

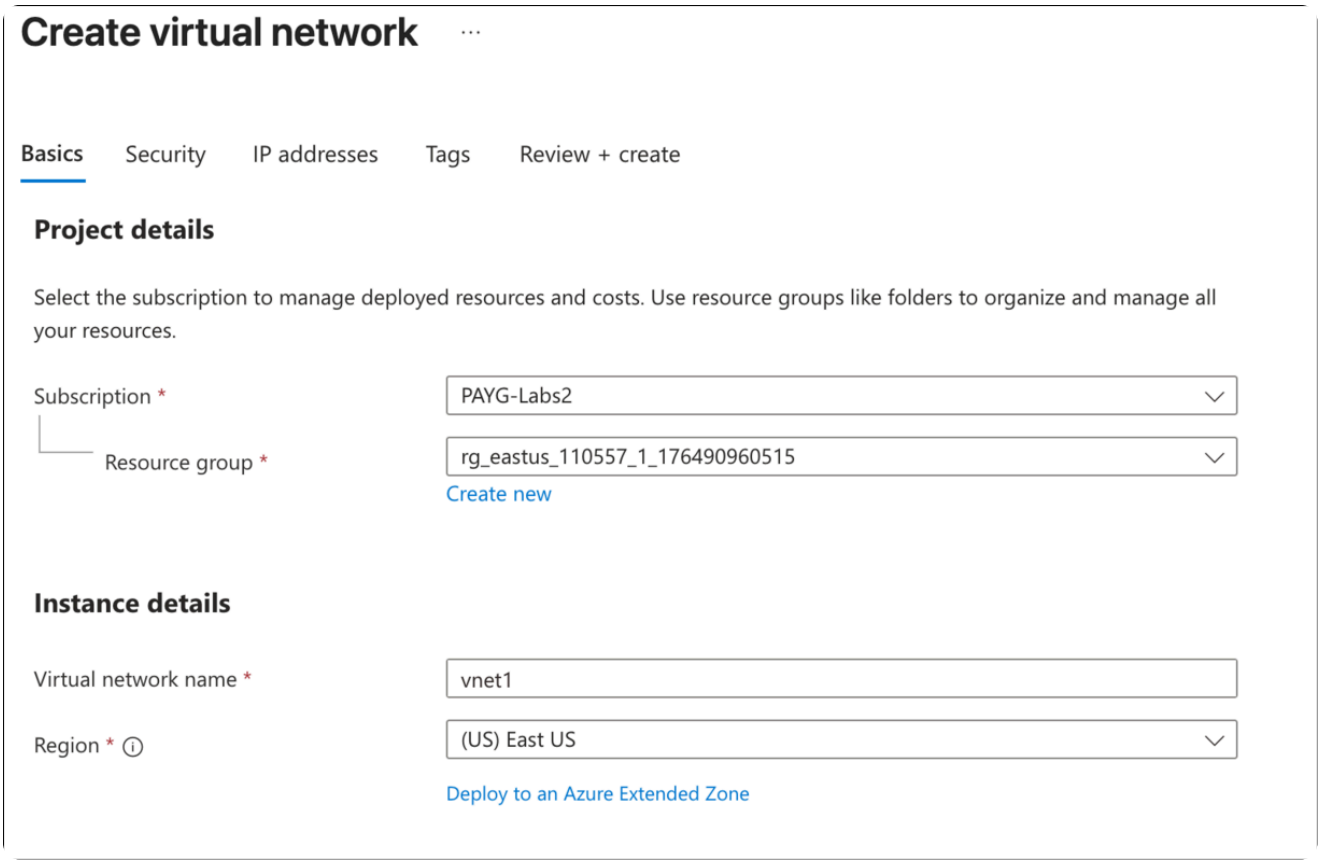

2. In **Virtual networks**, select **+ Create**.

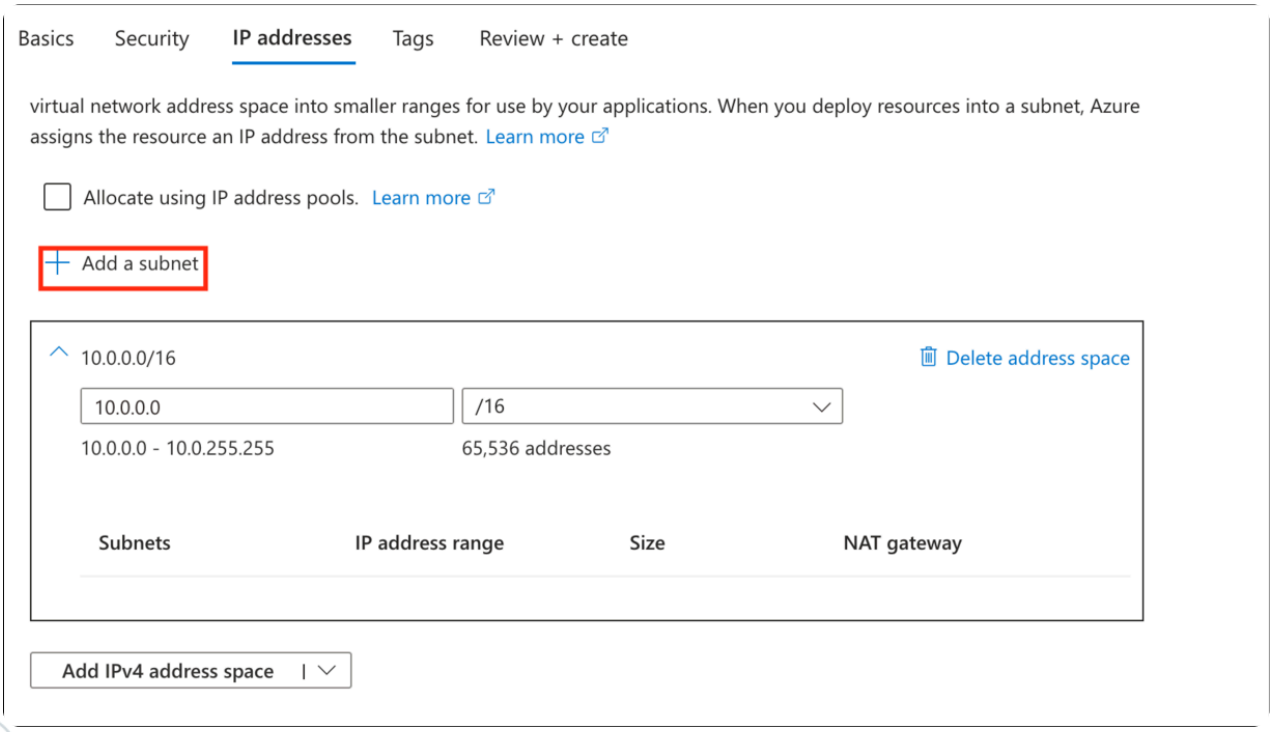

3. In **Create virtual network** page, enter or select the following information in the **Basics** tab:

- Resource group : Select **rg_eastus_XXXXX**
- Instance details :
- Name : Enter ***vnet1***
- Region : Select **East US**

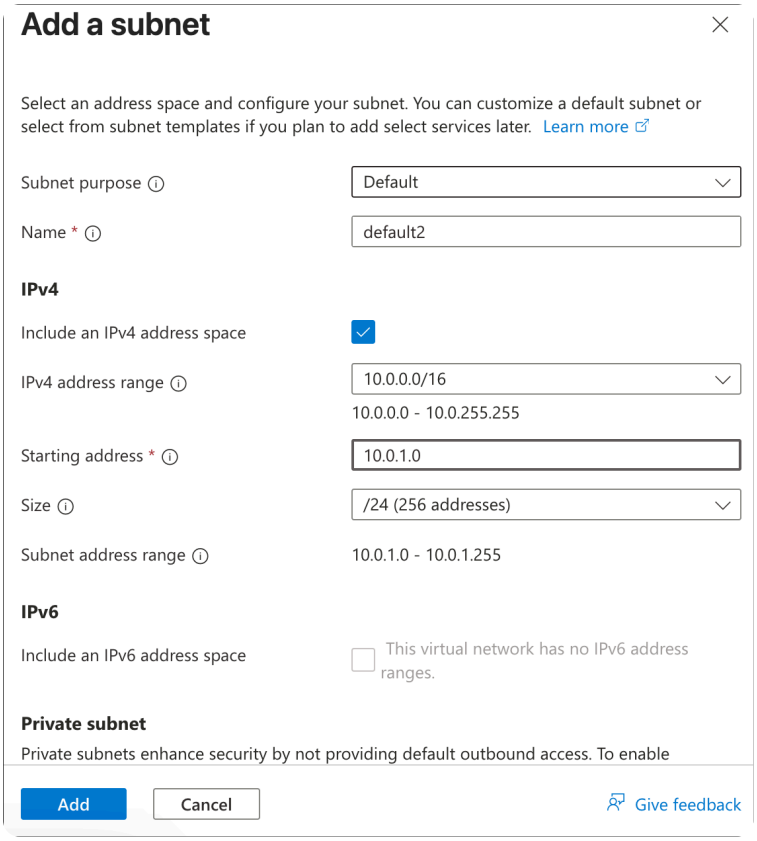

4. Select the **IP Addresses** tab. A IPV4 address with 10.0.0.0/16 will be already available. Click on **Add a subnet**.

- In **Add a subnet** section, enter the following information :
- IP address space : Select ***10.0.0.0/16***

- Subnet templete : Select **default**
- Name : Enter ***default2***
- Starting Address range: Enter ***10.0.1.0/24***
- NAT gateway: Leave the defaults
- Service gateway: Leave the defaults
- Click on **Add.**

5. Leave all the settings as default and select the **Review + Create** button and then click on **Create**. This step may take a few minutes.

6. You will now see a page displaying **Your deployment is complete**.

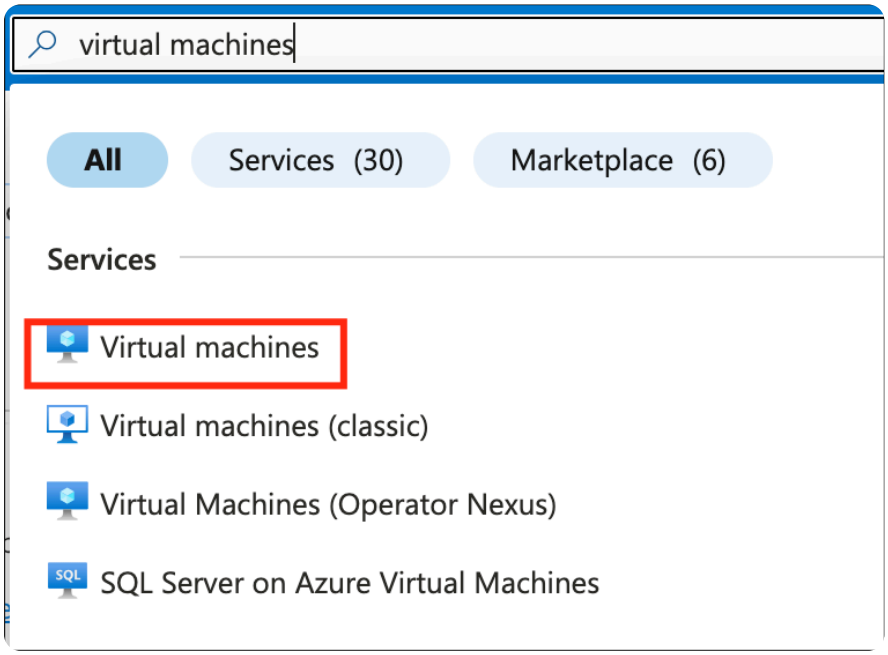

> **Do you Know?**
>
> Azure Virtual Network provides built-in Azure DDoS Protection Standard, ensuring automatic and scalable defense against DDoS attacks for enhanced network security.

Task 3: Create two virtual machines

In this task, we will create Virtual Machines to test the connection.

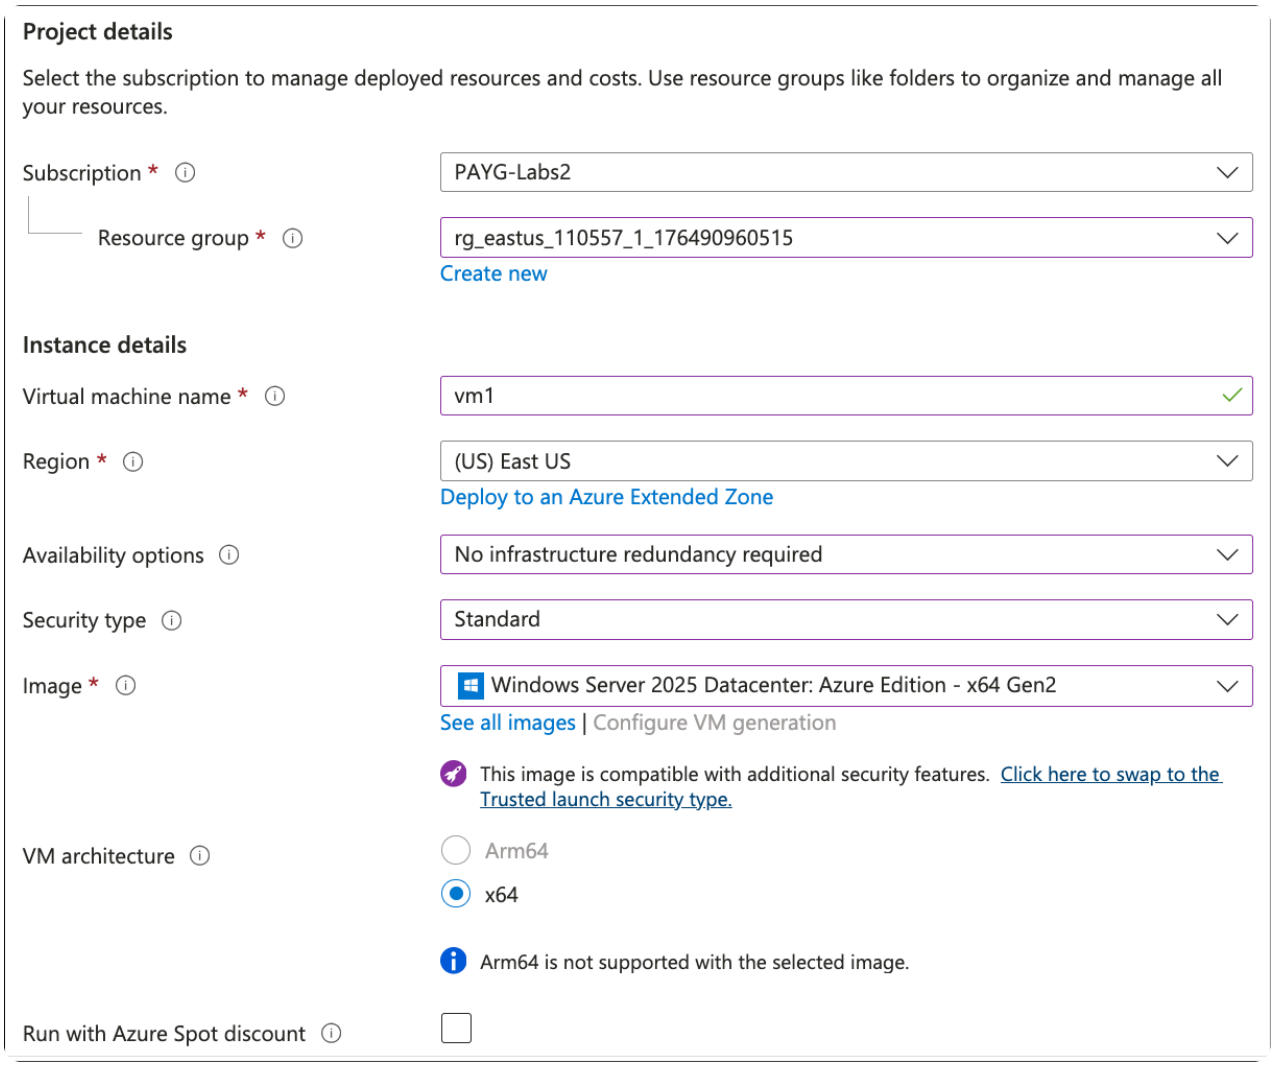

1. In the search box at the top of the Azure portal, enter **Virtual machine**. Select **Virtual machines** from the search results.

2. In the **Virtual machines** section, select **+ Create** and select **Virtual machine**. Now, enter the following values in the **Basics** tab.

- Resource group : Select **rg_eastus_XXXXX**
- Instance details :
- Virtual Machine Name : Enter ***vm1***
- Region : Select **(US) East US**
- Availability Options : **No infrastructure redundancy required**

  Security type: Standard
- Image : Select **Windows Server 2025 Datacenter : Azure Edition -x64 Gen2**
- Azure Spot instance : Leave the default of unchecked.

Size : Click on **see all sizes** then select **B2s** under **B-Series** and then **click on Select**

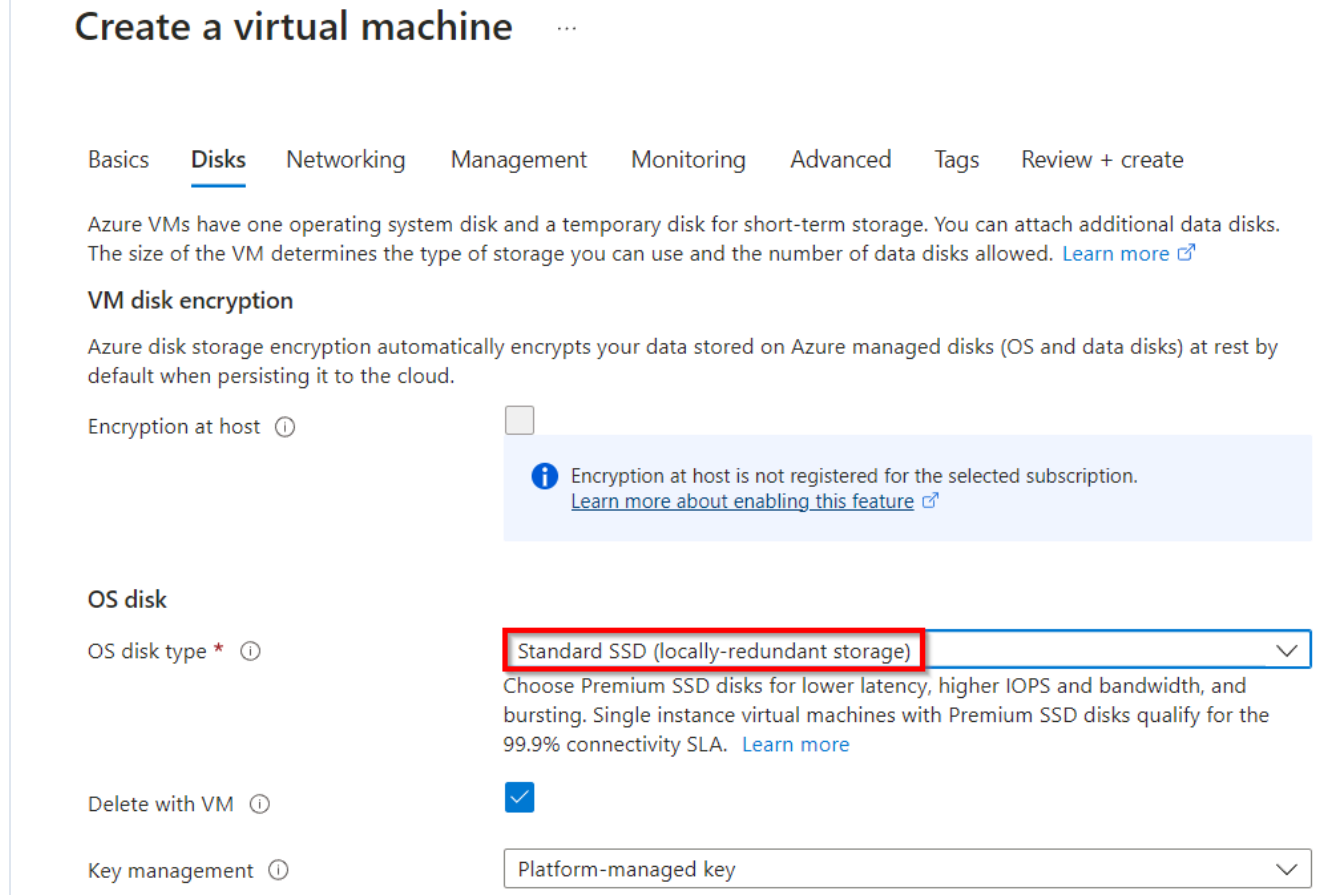

- Administrator Account :
- Username : Enter a ***username***

- Password : Enter a ***password***
- Confirm password : Re-enter ***password***
- Inbound Port rules :
- Public inbound ports : Select **Allow selected ports**
- Select inbound ports : Select **HTTP, SSH and RDP**

3. Now, click on **Next** and go to the **Disks** section. Select the following information:

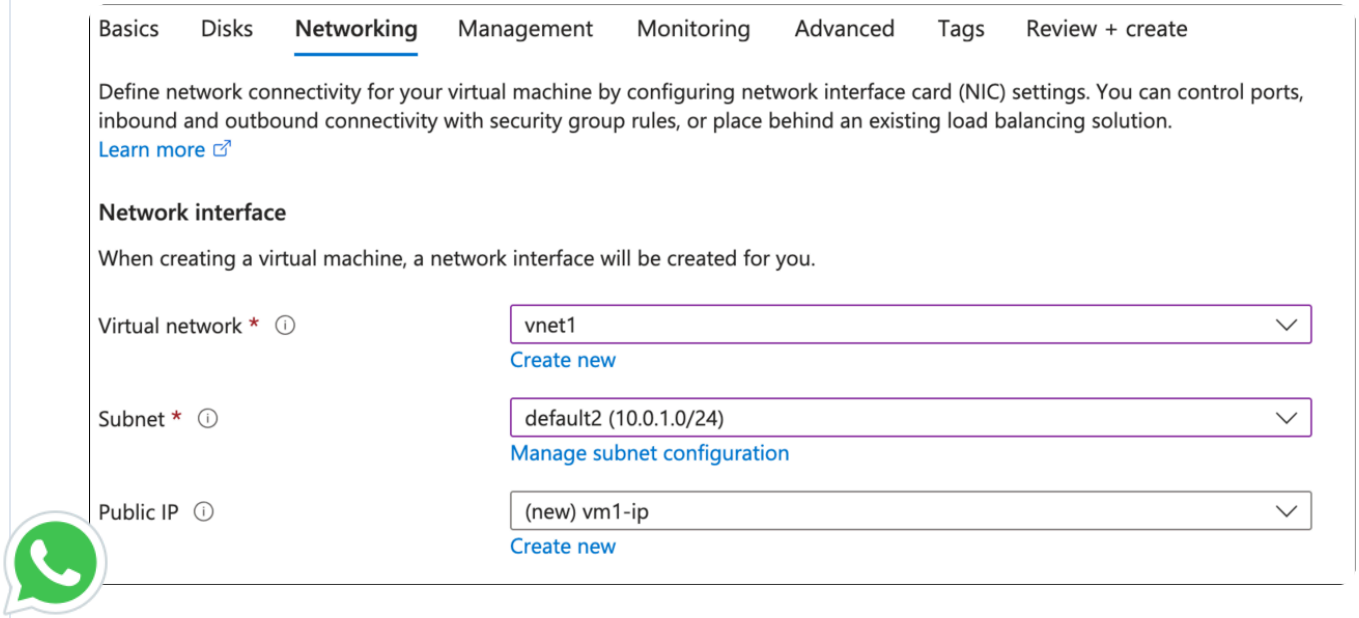

- OS disk type : Select **Standard SSD**

4. Click on **Next** and on the **Networking** tab, select the following information:

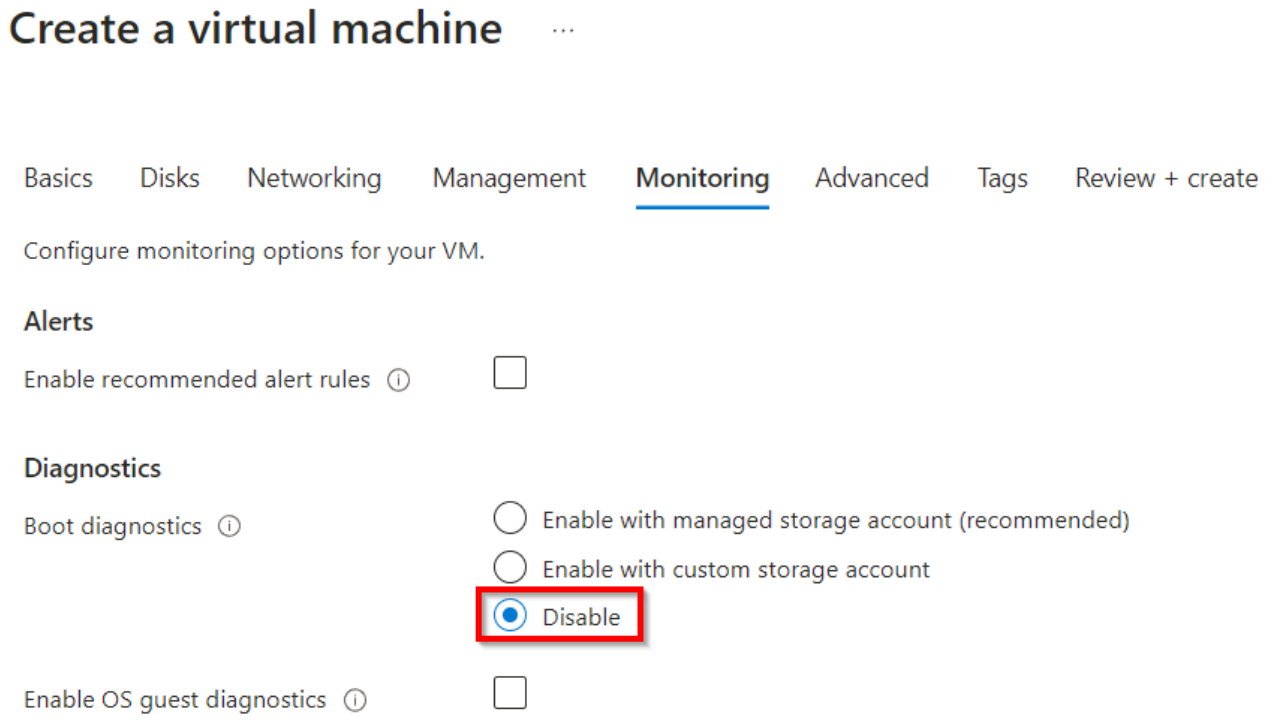

- Virtual network : Select **vnet1**

  Subnet: Select **default2**

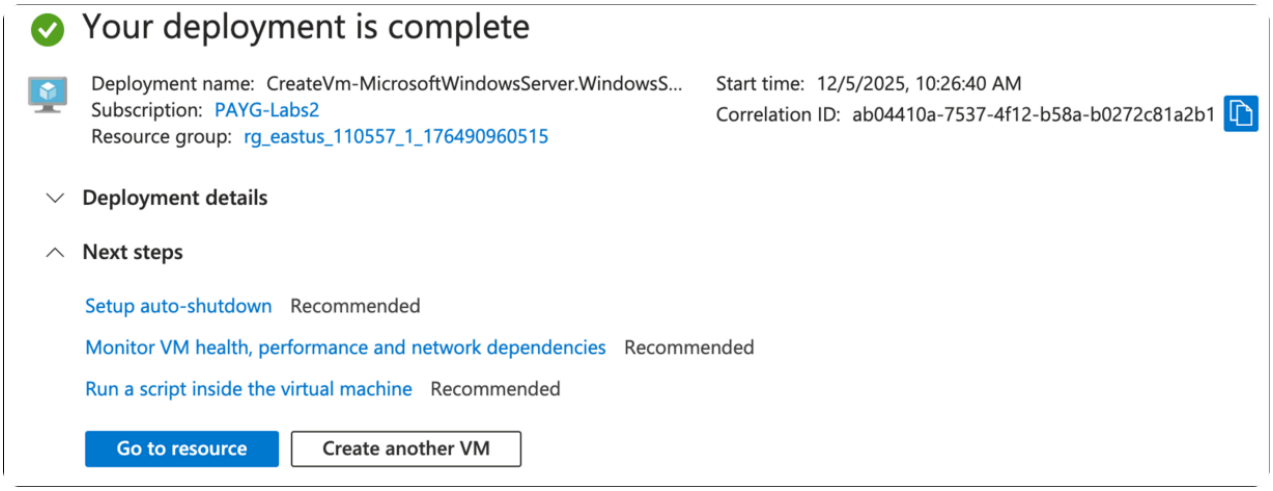

5. Go to the **Monitoring** tab, and select the following information:

- Boot diagnostics : Select **Disable**

6. Leave all the settings as default and select the **Review + Create** button and then click on **Create**. This step may take a few minutes.

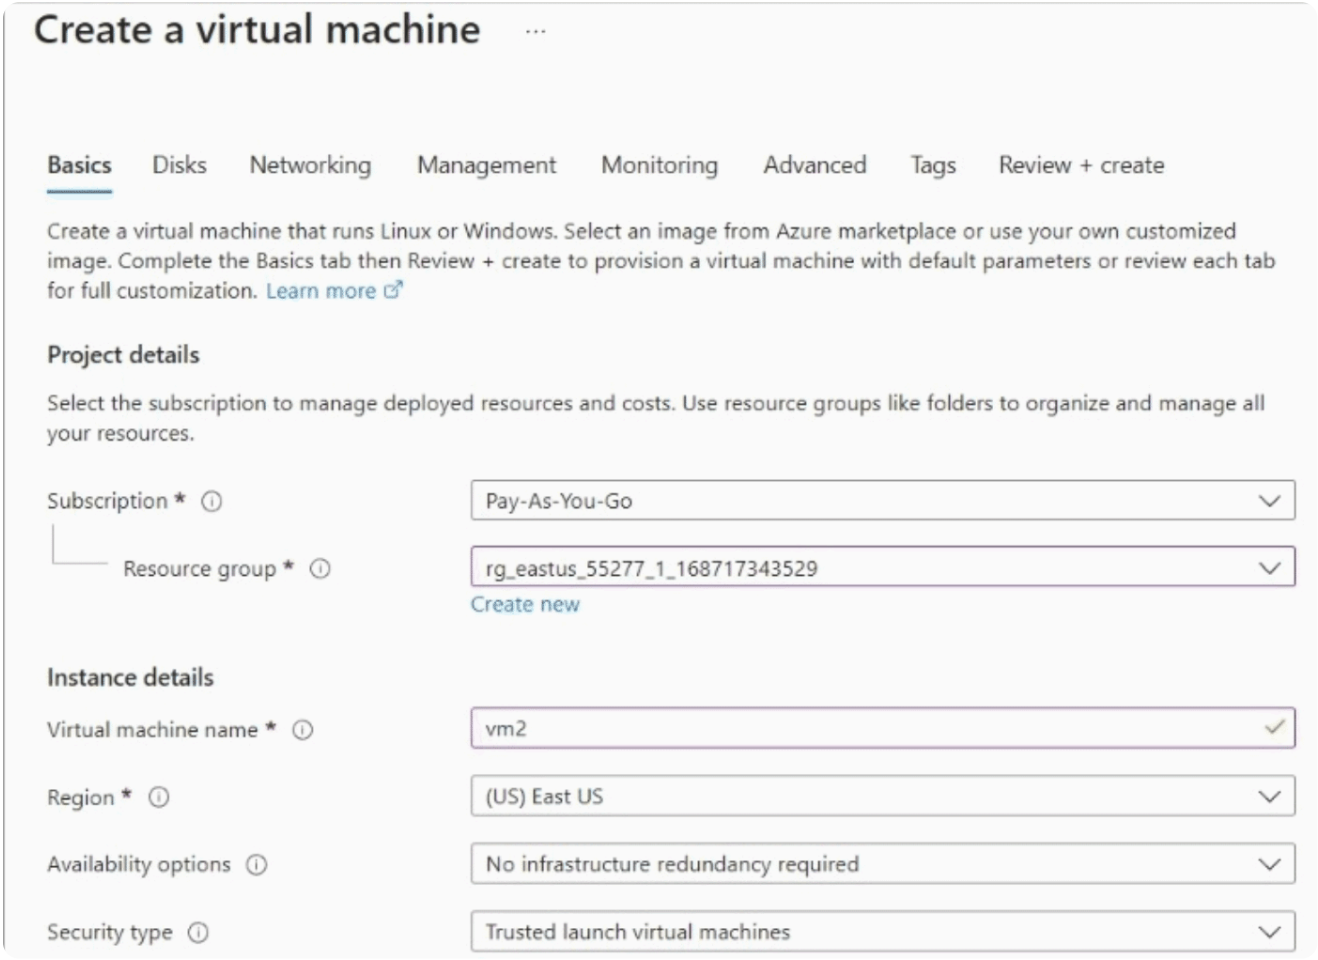

7. You will now see a page displaying **Your deployment is complete**.

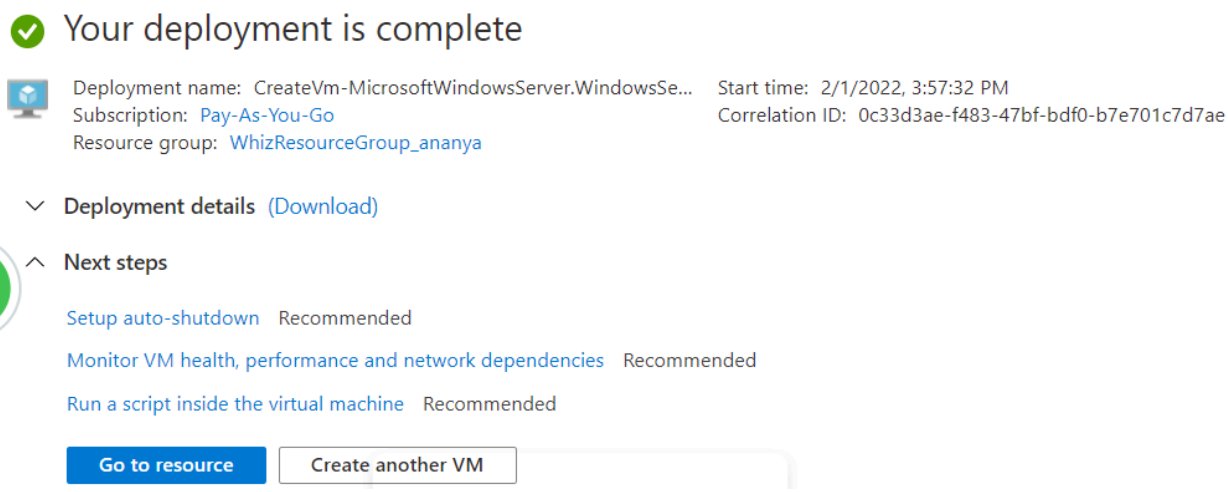

Now, create another virtual machine by following the above steps with the following configurations :

- Resource Group : Select **rg_eastus_XXXXX**

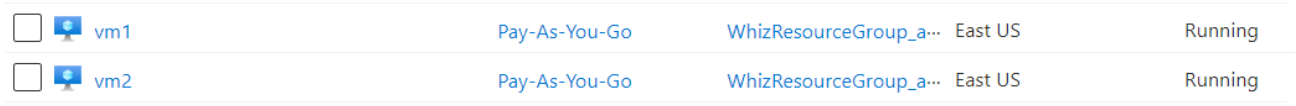

- Virtual Machine Name : Enter ***vm2***
- In the Disks tab, select OS Disk type as **Standard SSD**
- Select inbound ports : Select **HTTP, SSH and RDP**
- In **Networking** Tab, Virtual Network : select **vnet1** and select **default2** as Subnet
- Click on **Review + create** and then **create**

9. You will now see a page displaying **Your deployment is complete**.

10. You can see that both the virtual machines are created and being displayed.

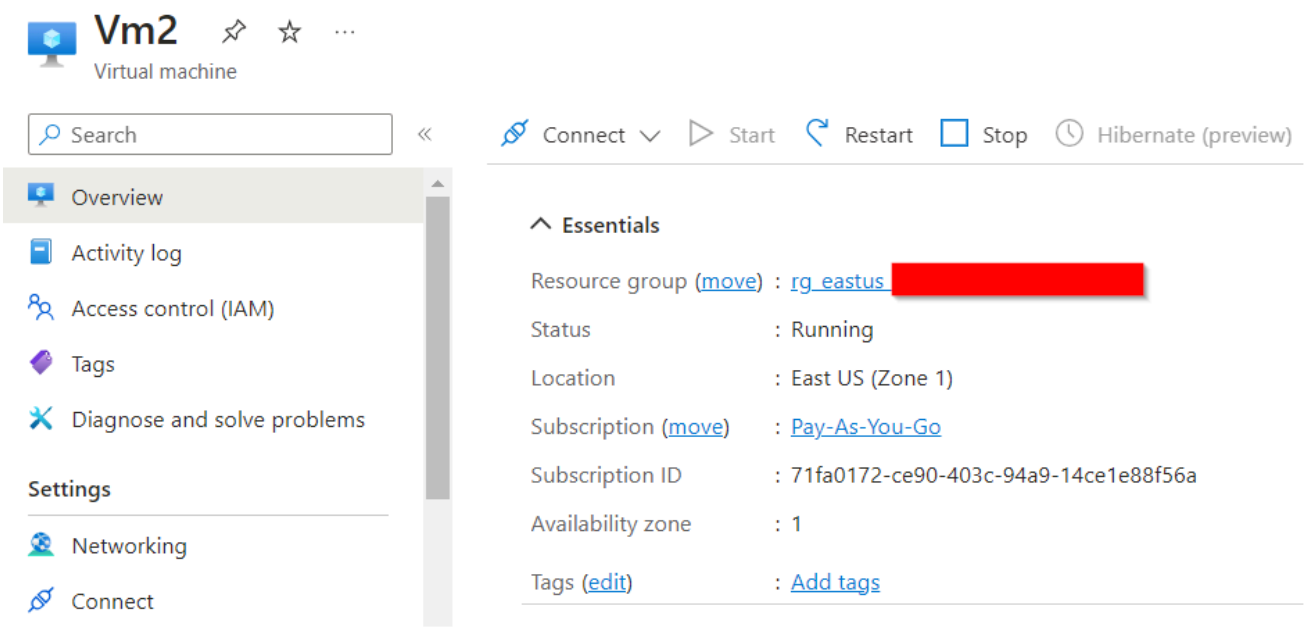

Task 4: Test the Connection

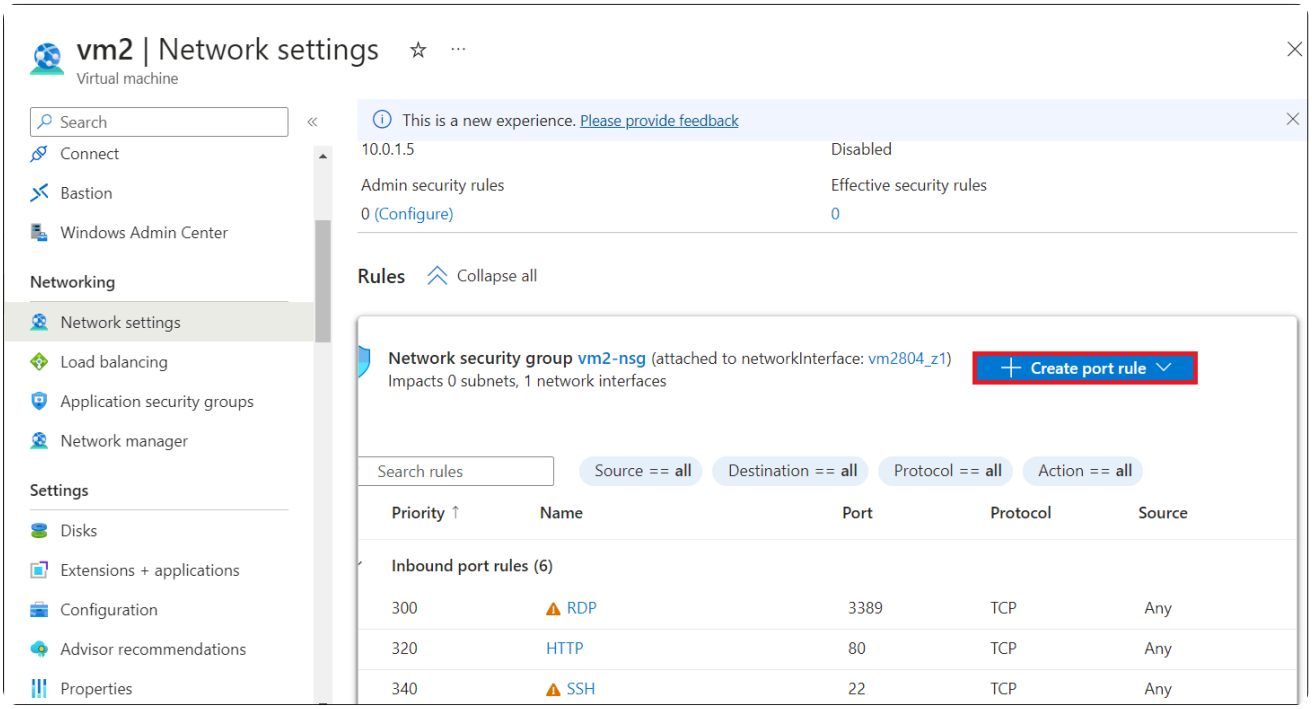

In this task, we will allow ICMP connections between VMs and test whether the virtual machines can communicate (ping) each other.

1. Search for **Virtual machines** in the Search bar and select it.

2. Select **vm2**, open its **Overview** page.

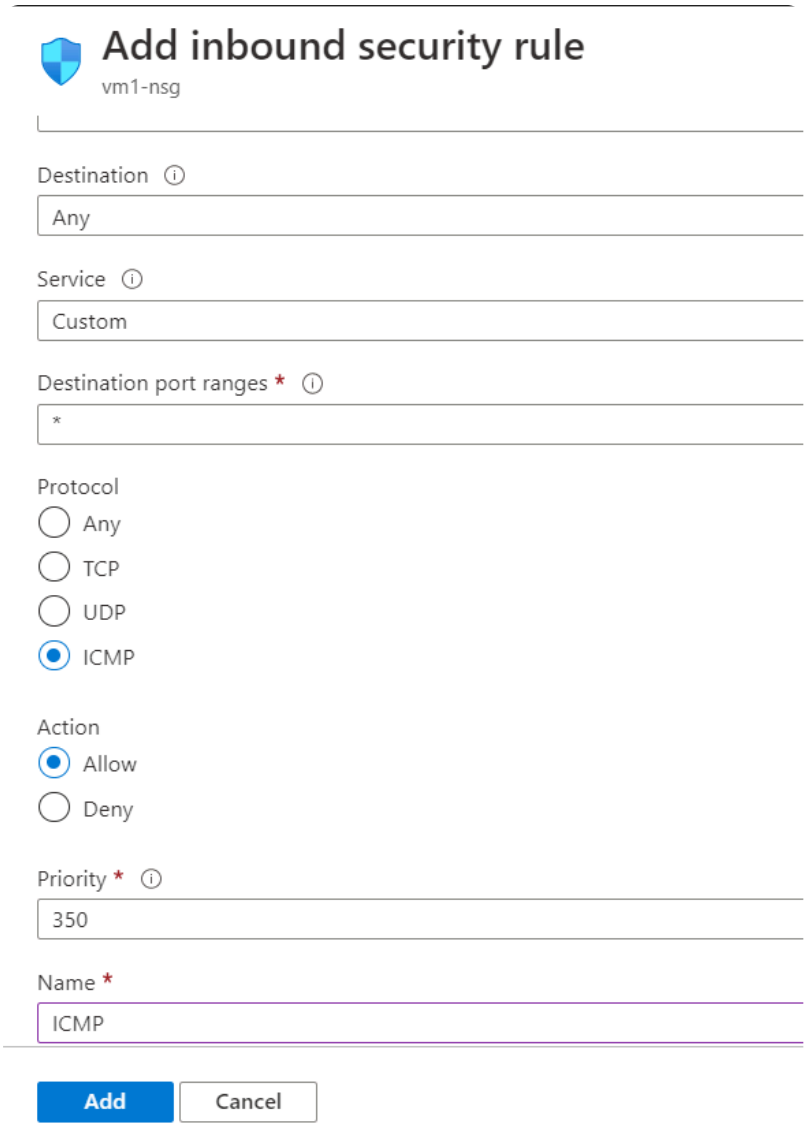

3. On the **Overview** page of your VM, under **Networking** section, go to **Network settings**, here you can see the network interface which has the public ip address and the private ip address and also the inbound and outbound port rules.

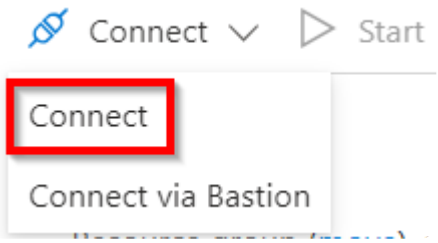

4. From the dropdown, click on **Inbound port rule** and enter or select the following information:

- Protocol : Select **ICMP**
- Name : Enter ***ICMP***
- Leave all the settings as default.
- Click on **Add**.

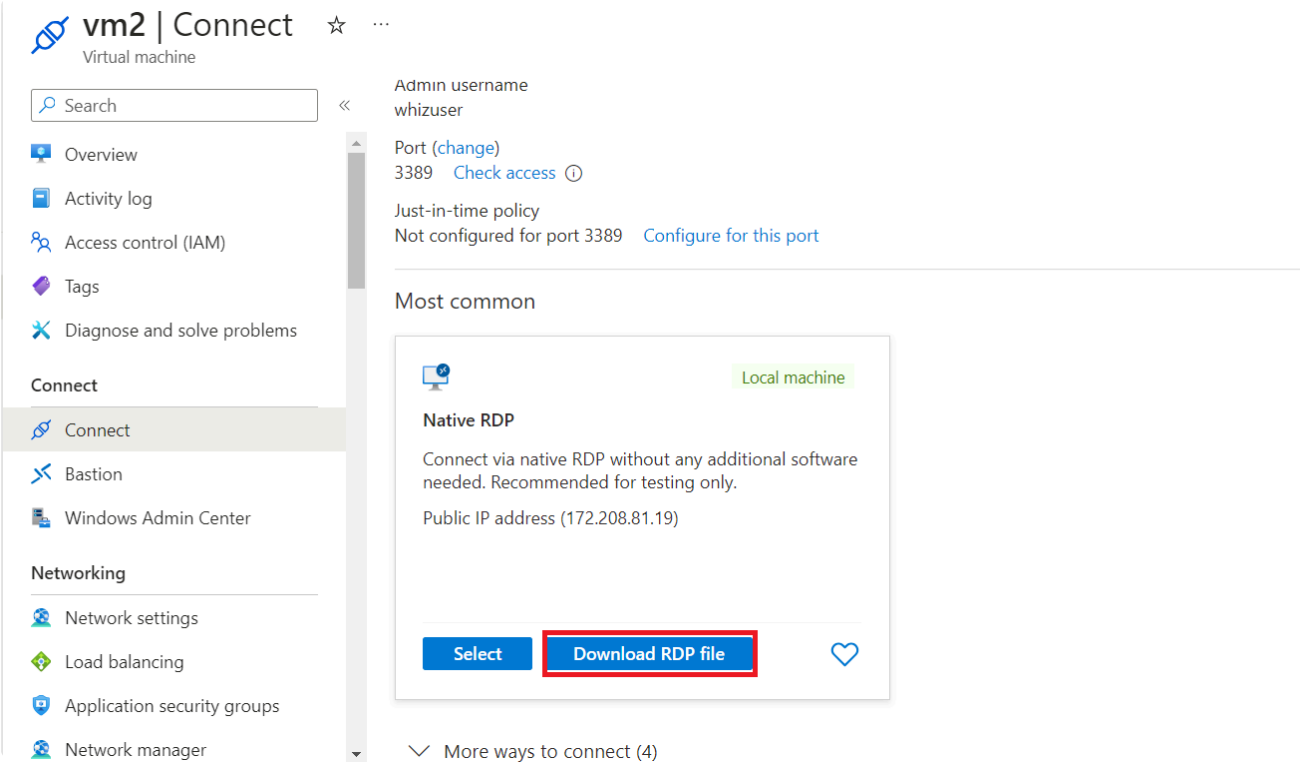

5. Go back to the overview page of vm2, click on **Connect** > Connect, select **Native RDP** and click on **Download RDP File** button.

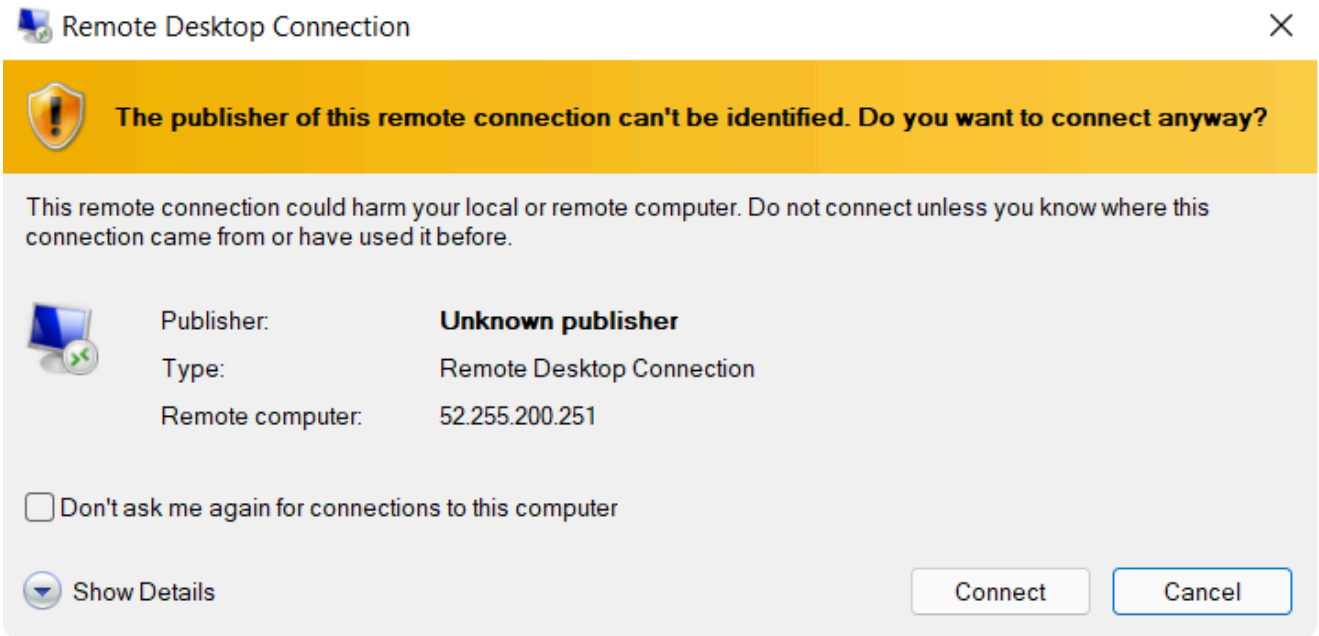

NOTE: If you are a **Linux** or **MAC** user:

- Download the RDP software and install it.
- Once installed, open the software and click on **Add PC**.
- Connect to your virtual machine using its public IP address and click on **Add**.

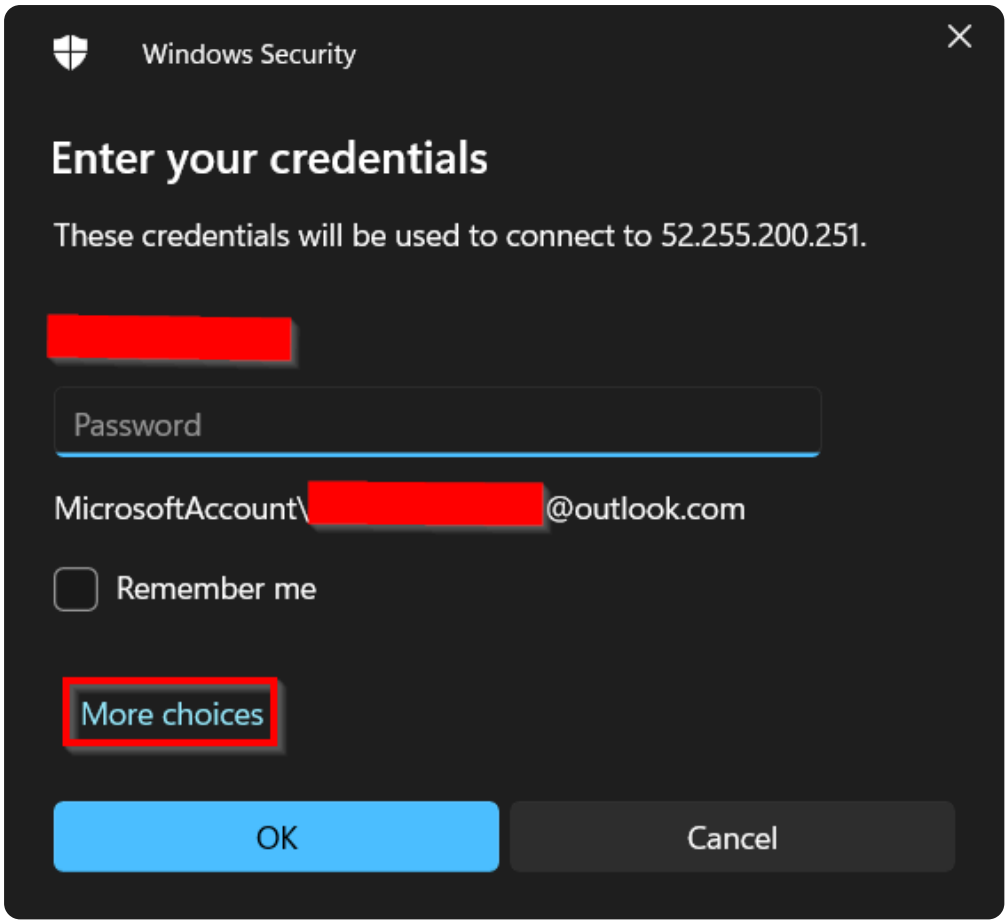

- Right click and open the PC, Enter ***username*** and ***password*** in the popup and click on continue on all further popups.

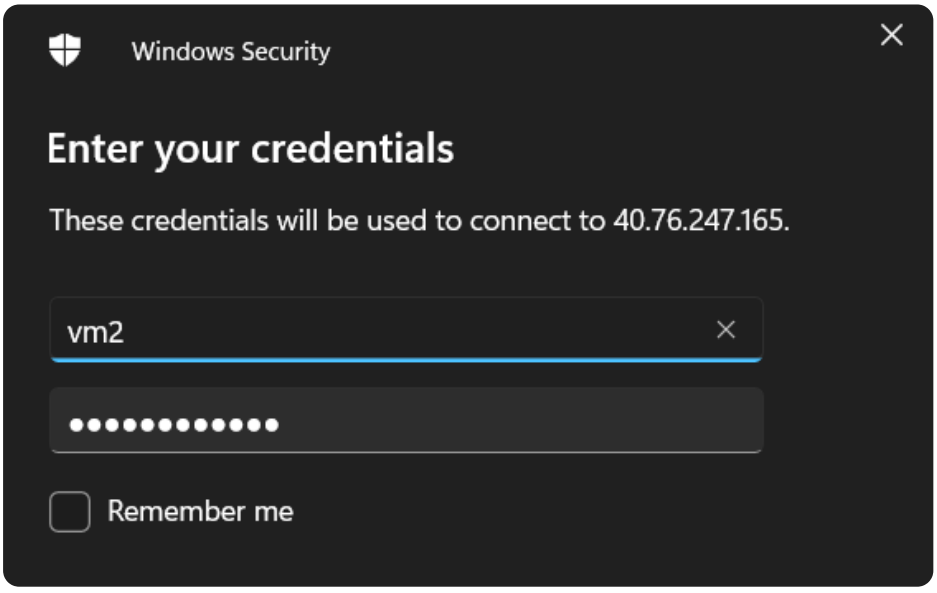

6. Open the download **RDP** file and select **Connect** on the displayed prompt.

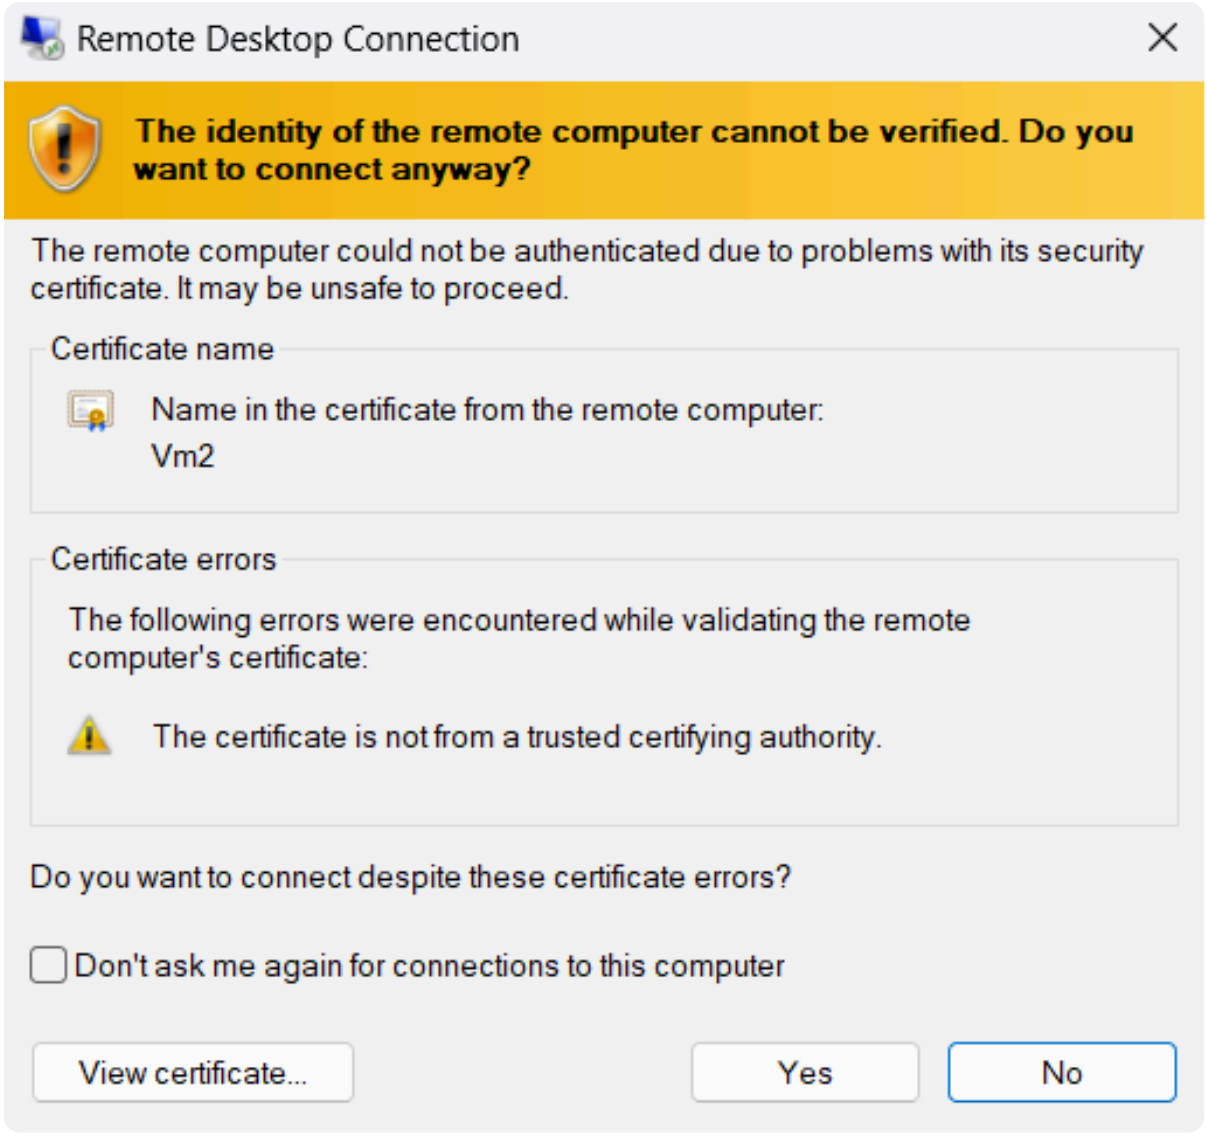

7. On the **Windows Security** prompt, click on **more choices.**

8. Click on **Use a different account** and enter the username and password you specified while creating the Virtual Machine and select **OK**.

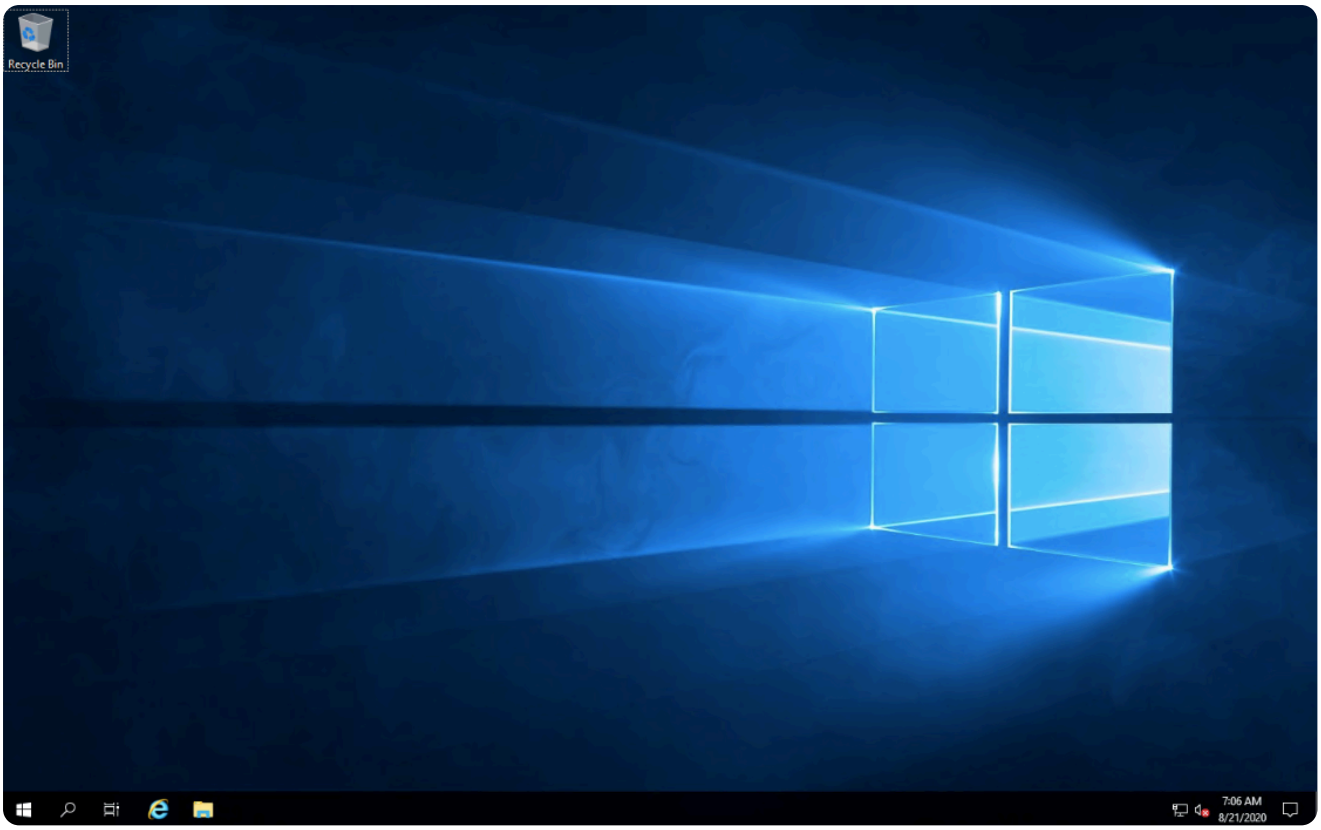

9. You may receive a certificate warning during the sign-in process. Select **Yes** to continue.

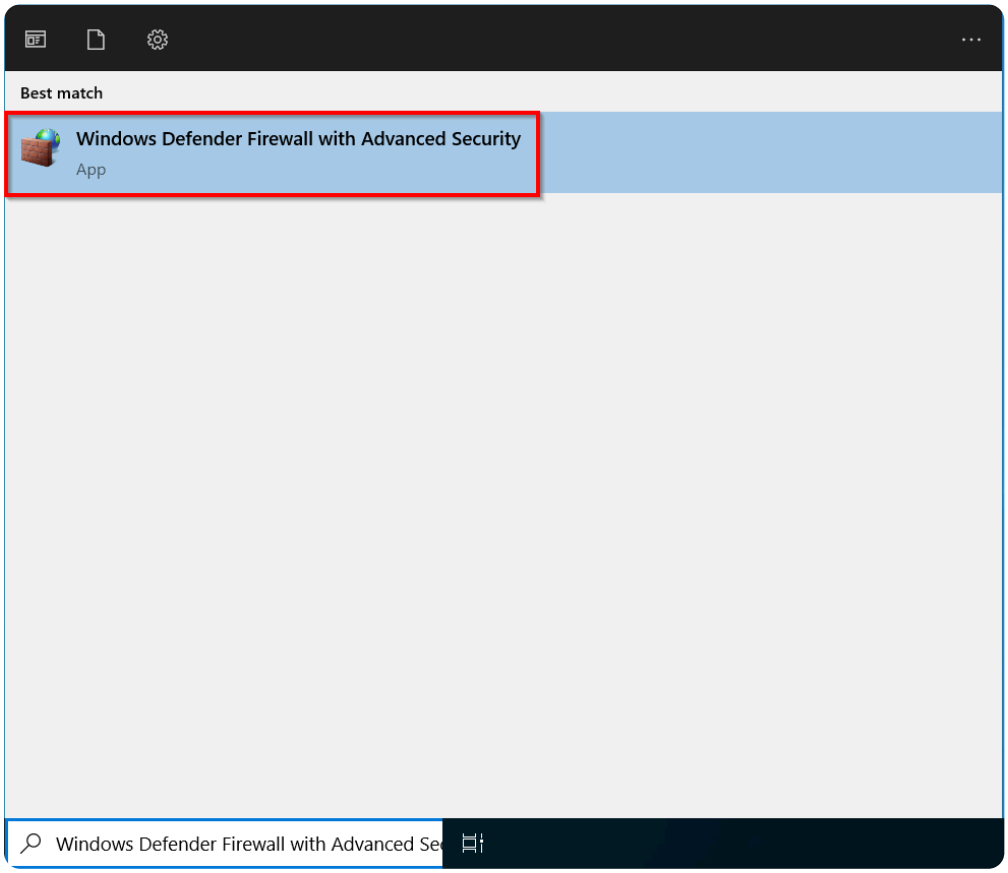

10. After successfully logging into the virtual machine, wait until the windows boots up and is ready to use.

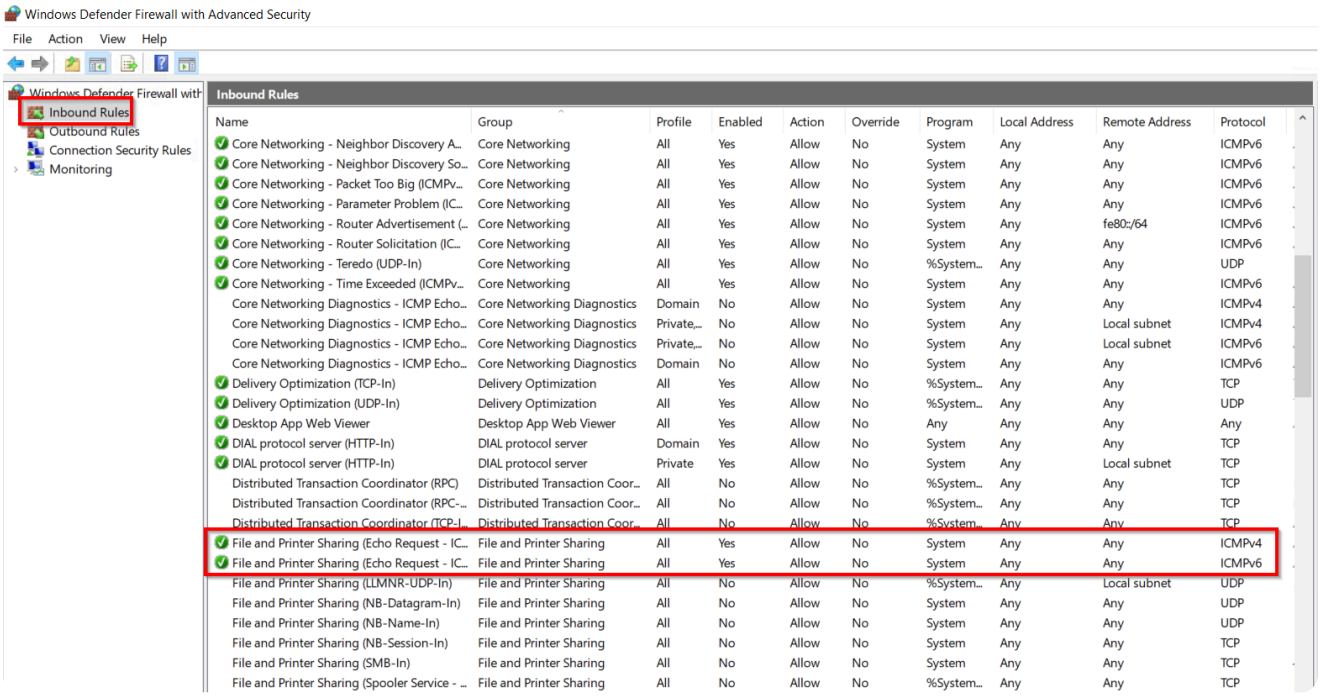

- If you see this message **Do you want to allow your PC to be discoverable by other PCs and devices on this network?** Click on **Yes**
- Your Virtual Machine is ready to use
- A **Server Manager** window might open by default

11. Now, in your virtual environment, search for **Windows Defender Firewall with Advanced Security**.

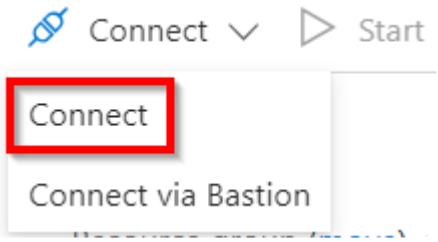

12. Open it and click on **Inbound rules**. Enable the following ICMP rules.

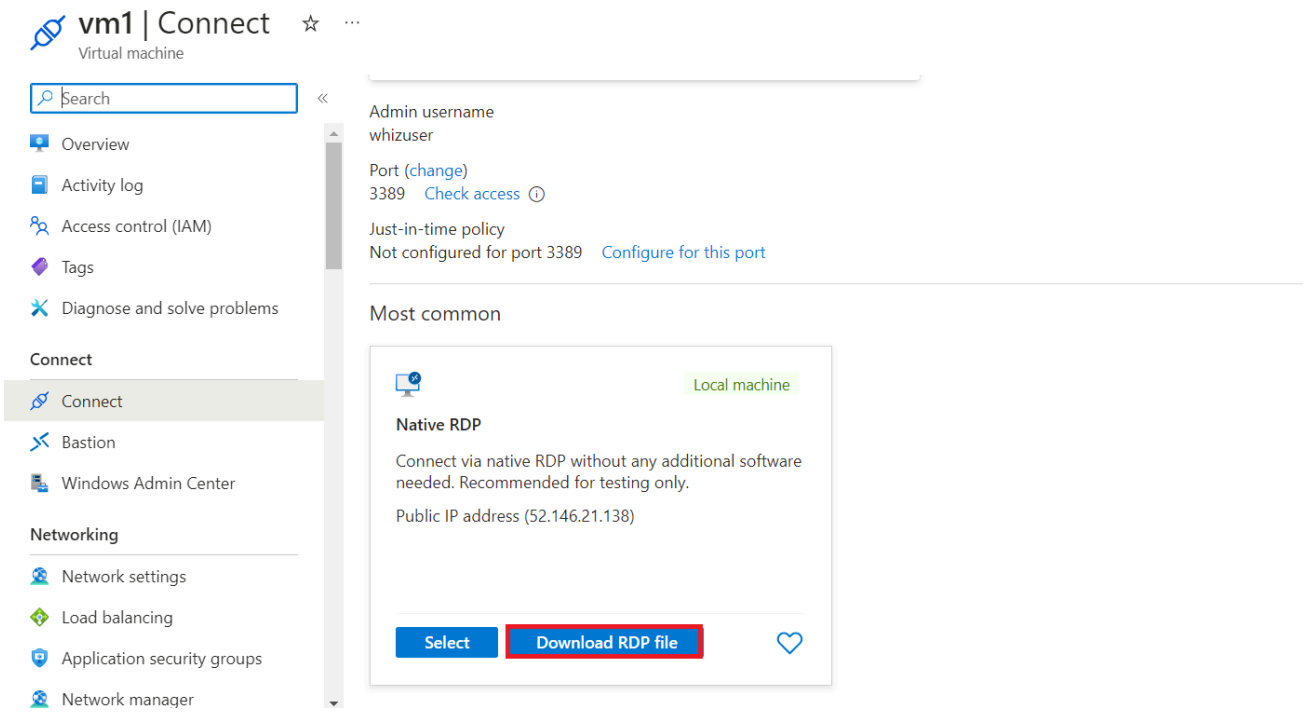

13. Now, close the **vm2** session and return to Azure portal.

14. Now, go To The Overview Page Of **Vm1**, Click On **Connect** > Connect, Select **Native RDP** And Click On **Download RDP File** Button.

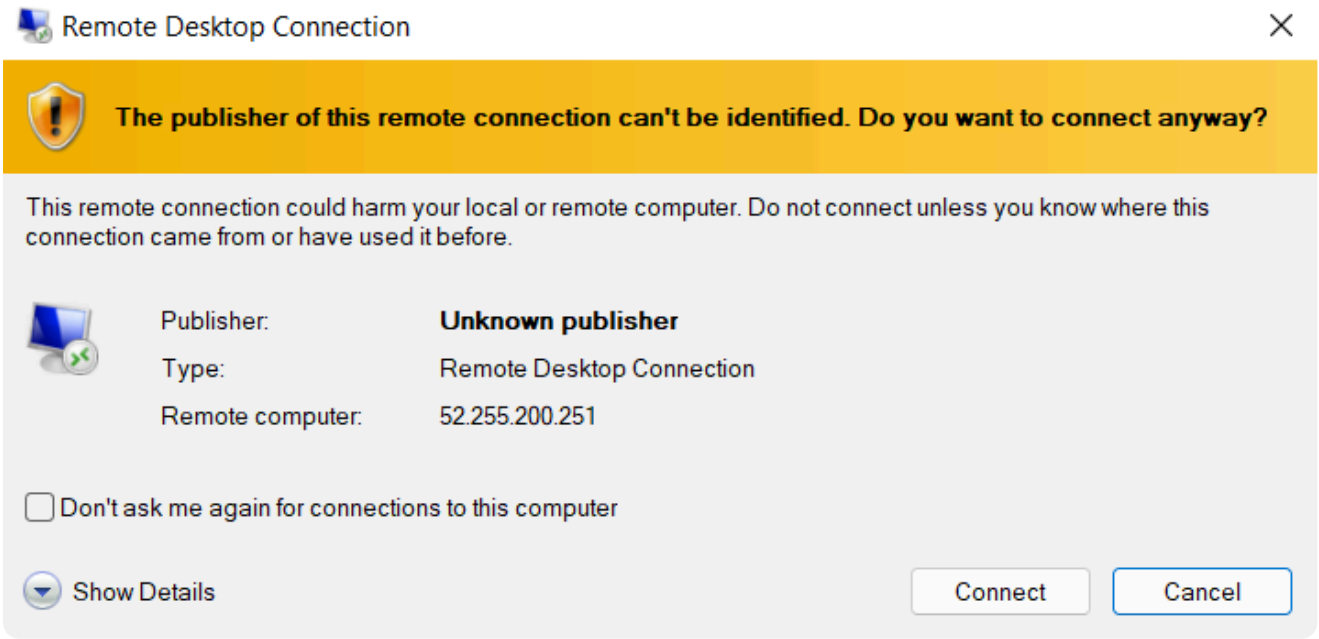

NOTE: If you are a **Linux** or **MAC** user:

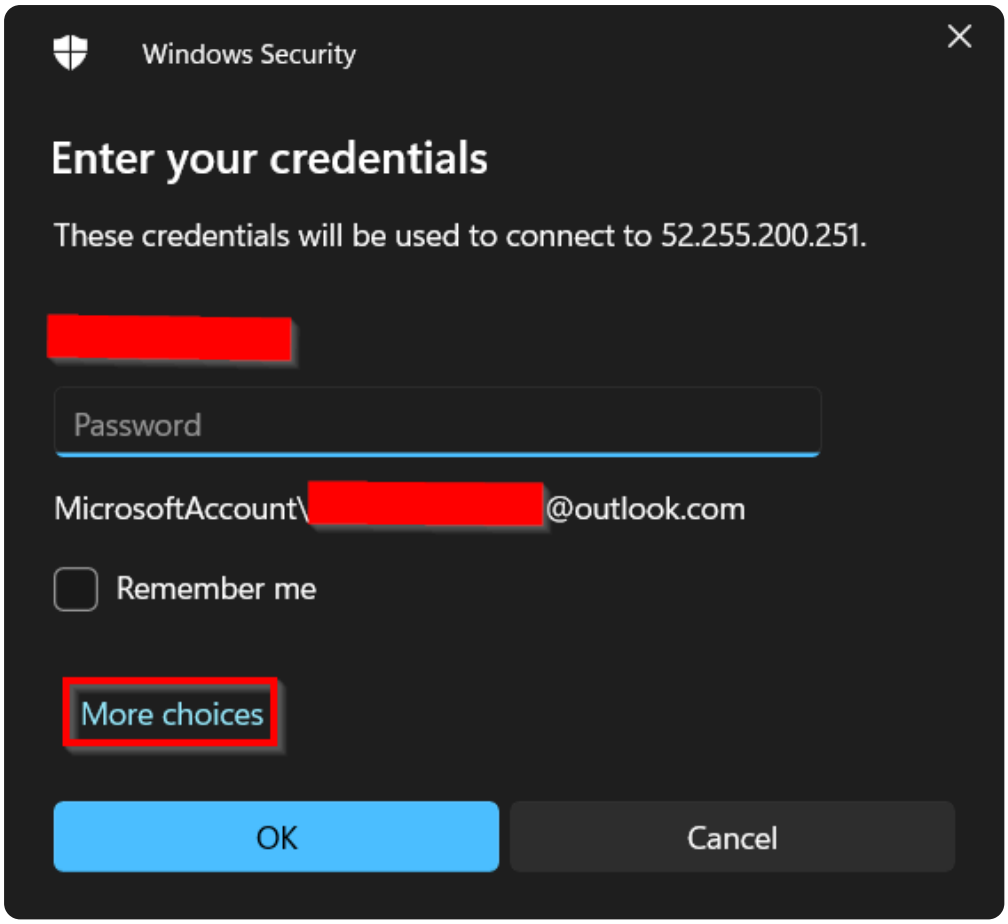

- Download the RDP software and install it.
- Once installed, open the software and click on **Add PC**.
- Connect to your virtual machine using its public IP address and click on **Add**.
- Right click and open the PC, Enter ***username*** and ***password*** in the popup and click on continue on all further popups.

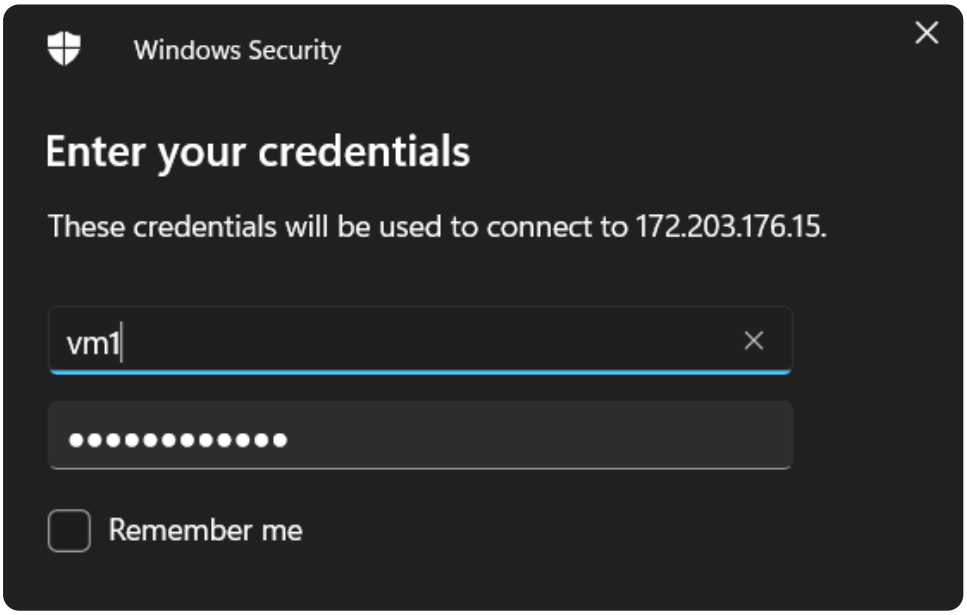

15. Open the download **RDP** file and select **Connect** on the displayed prompt.

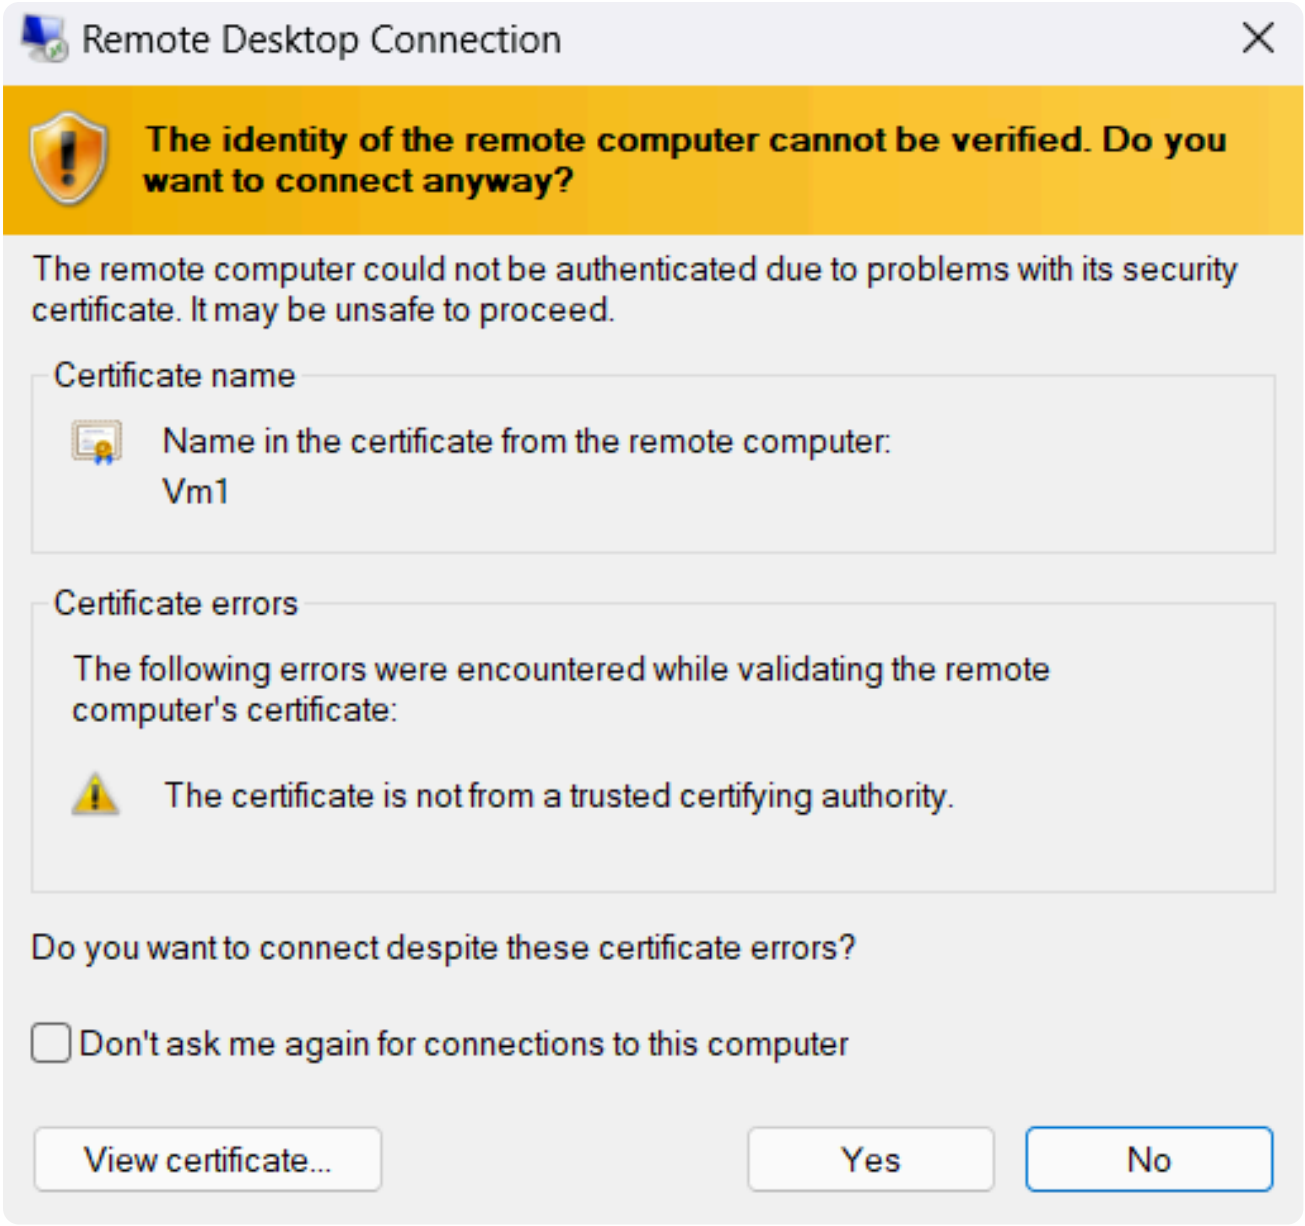

16. On the **Windows Security** prompt, click on **more choices.**

17. Click on **Use a different account** and enter the username and password you specified while creating the Virtual Machine and select **OK**.

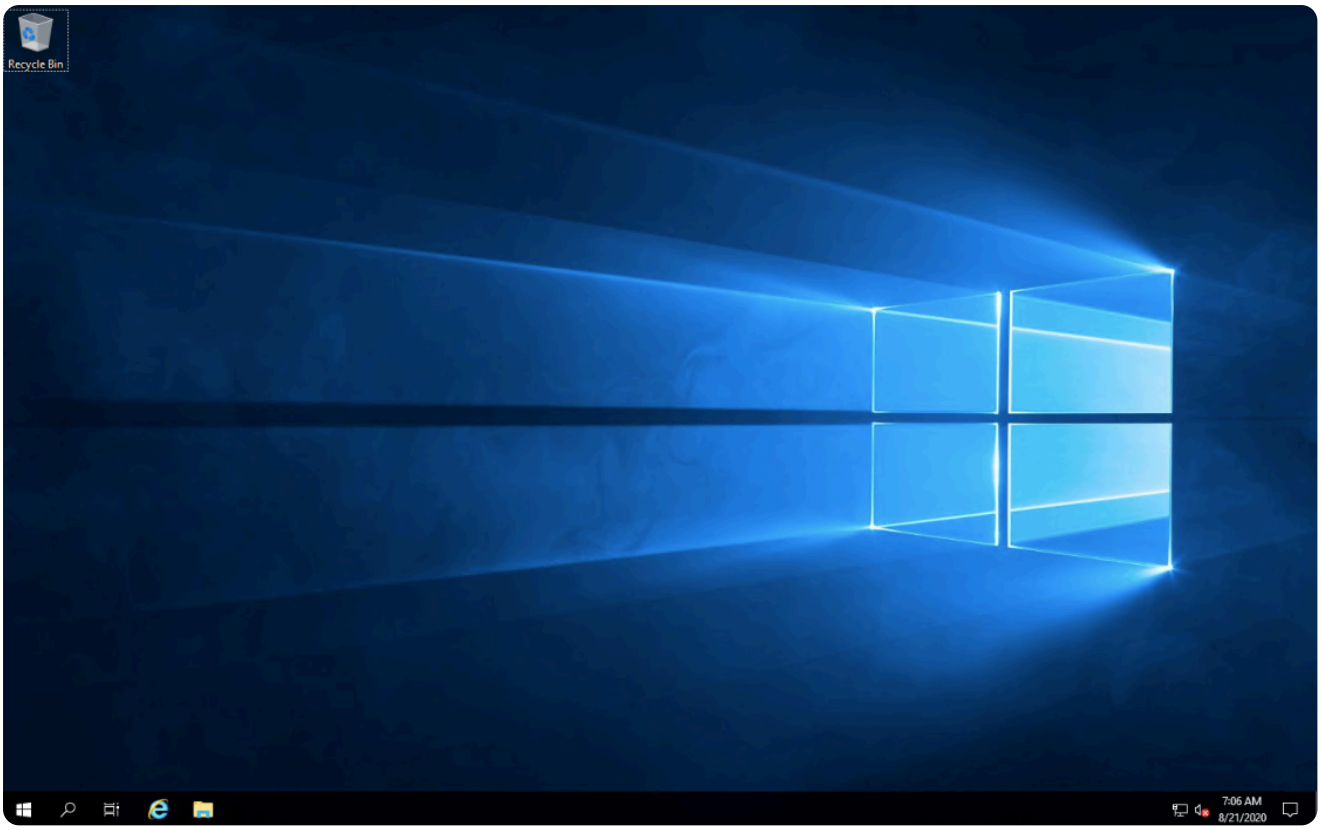

18. You may receive a certificate warning during the sign-in process. Select **Yes** to continue.

19. After successfully logging into the virtual machine, wait until the windows boots up and is ready to use.

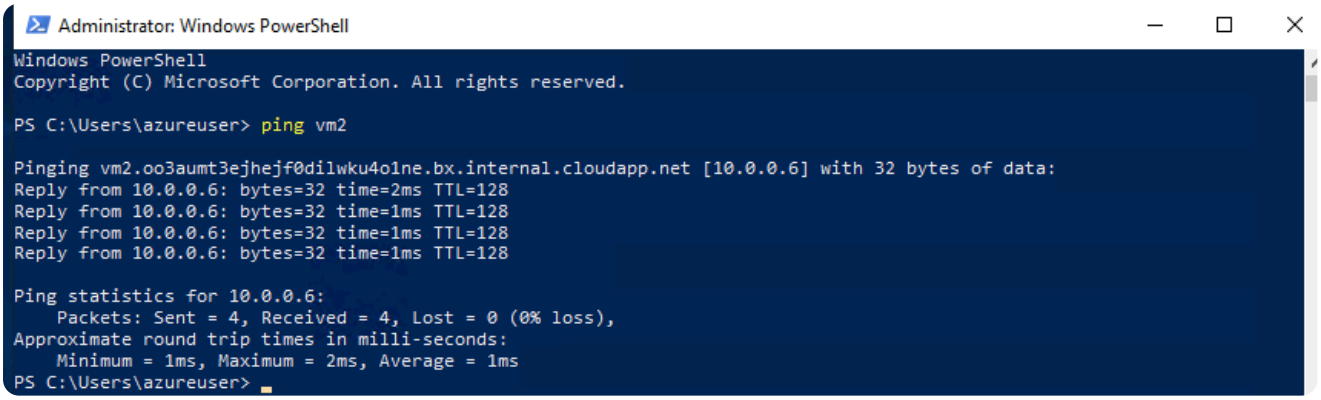

20. If you see this message **Do you want to allow your PC to be discoverable by other PCs and devices on this network?** Click on **Yes**

21. Your Virtual Machine is ready to use.

22. Now, on the virtual environment which is created for **vm1**, open up **Windows Powershell** and make sure to **run it as administrator**.

23. Try to ping vm2 by running the command ***ping vm2***.

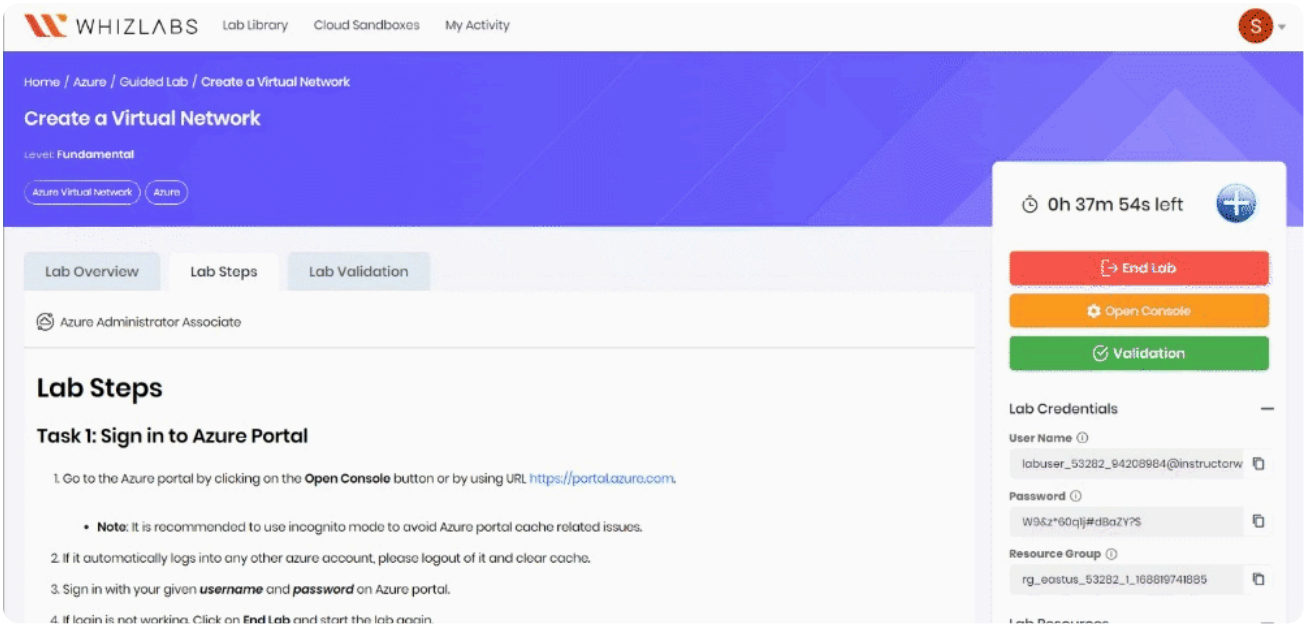

24. You successfully pinged VM2 from VM1.

Task 5: Validation test

1. Once the lab steps are completed, click on **Validation** button or go to **Lab Validation** section.

2. Click on **Validate My Lab** button. You will get the **"Lab Overall Status"** which will indicate whether or not you have completed the lab successfully.

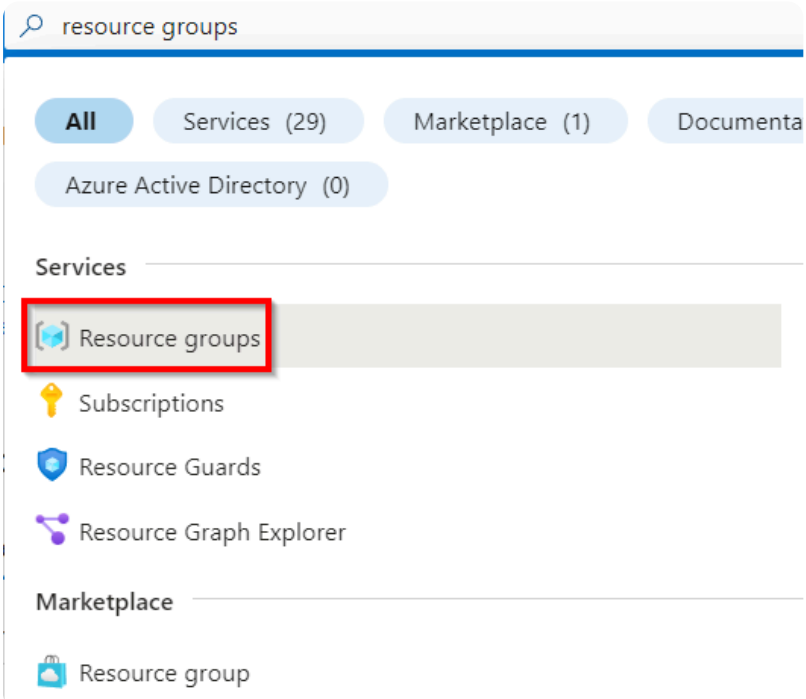

3. Sample output:

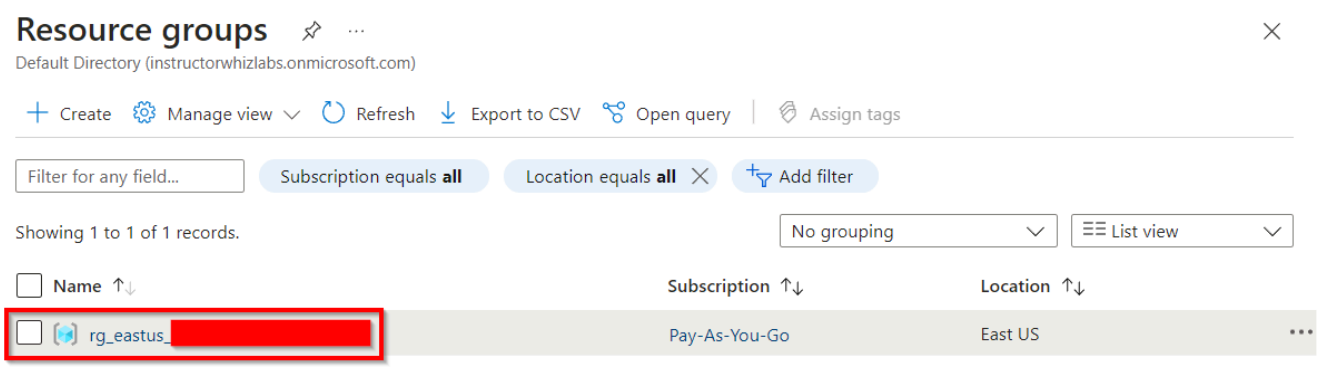

Task 6: Delete the Resources

In this task, we will delete all the resources.

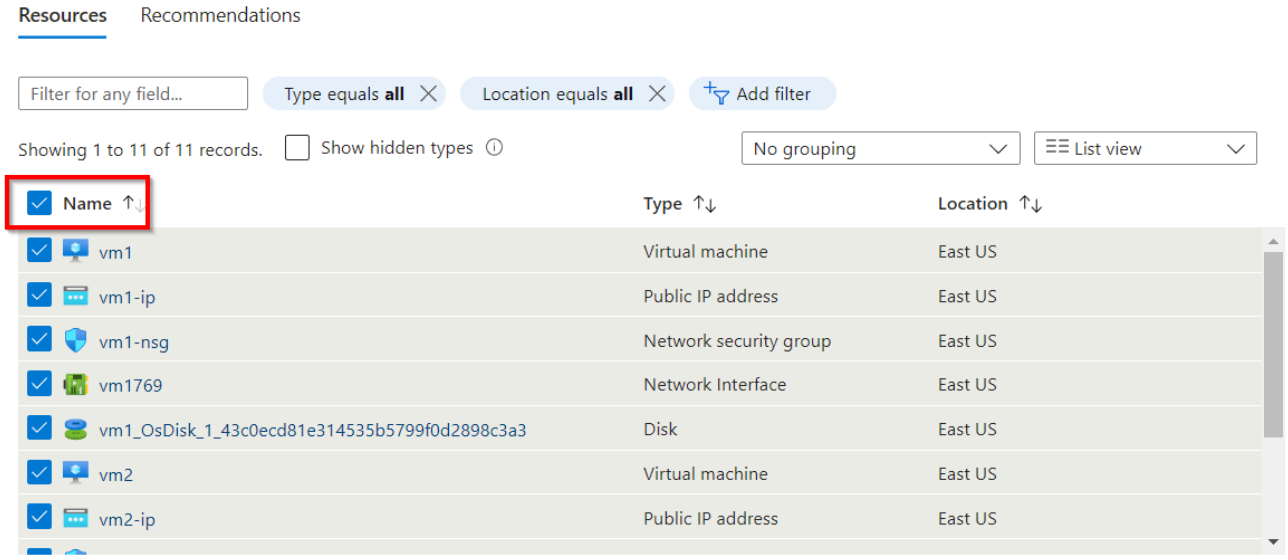

1. In the search box at the top of the Azure portal, enter **Resource groups**. Select **Resource groups** from the search results.

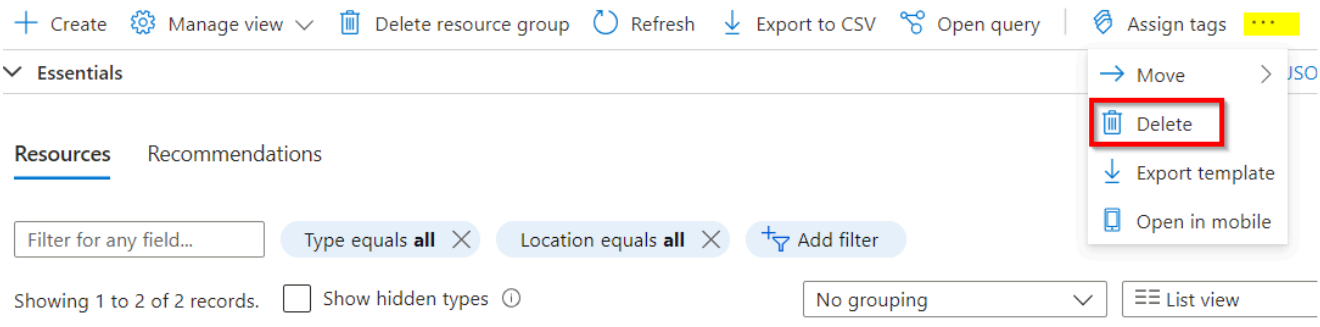

Click on the name of the **Resource groups**.

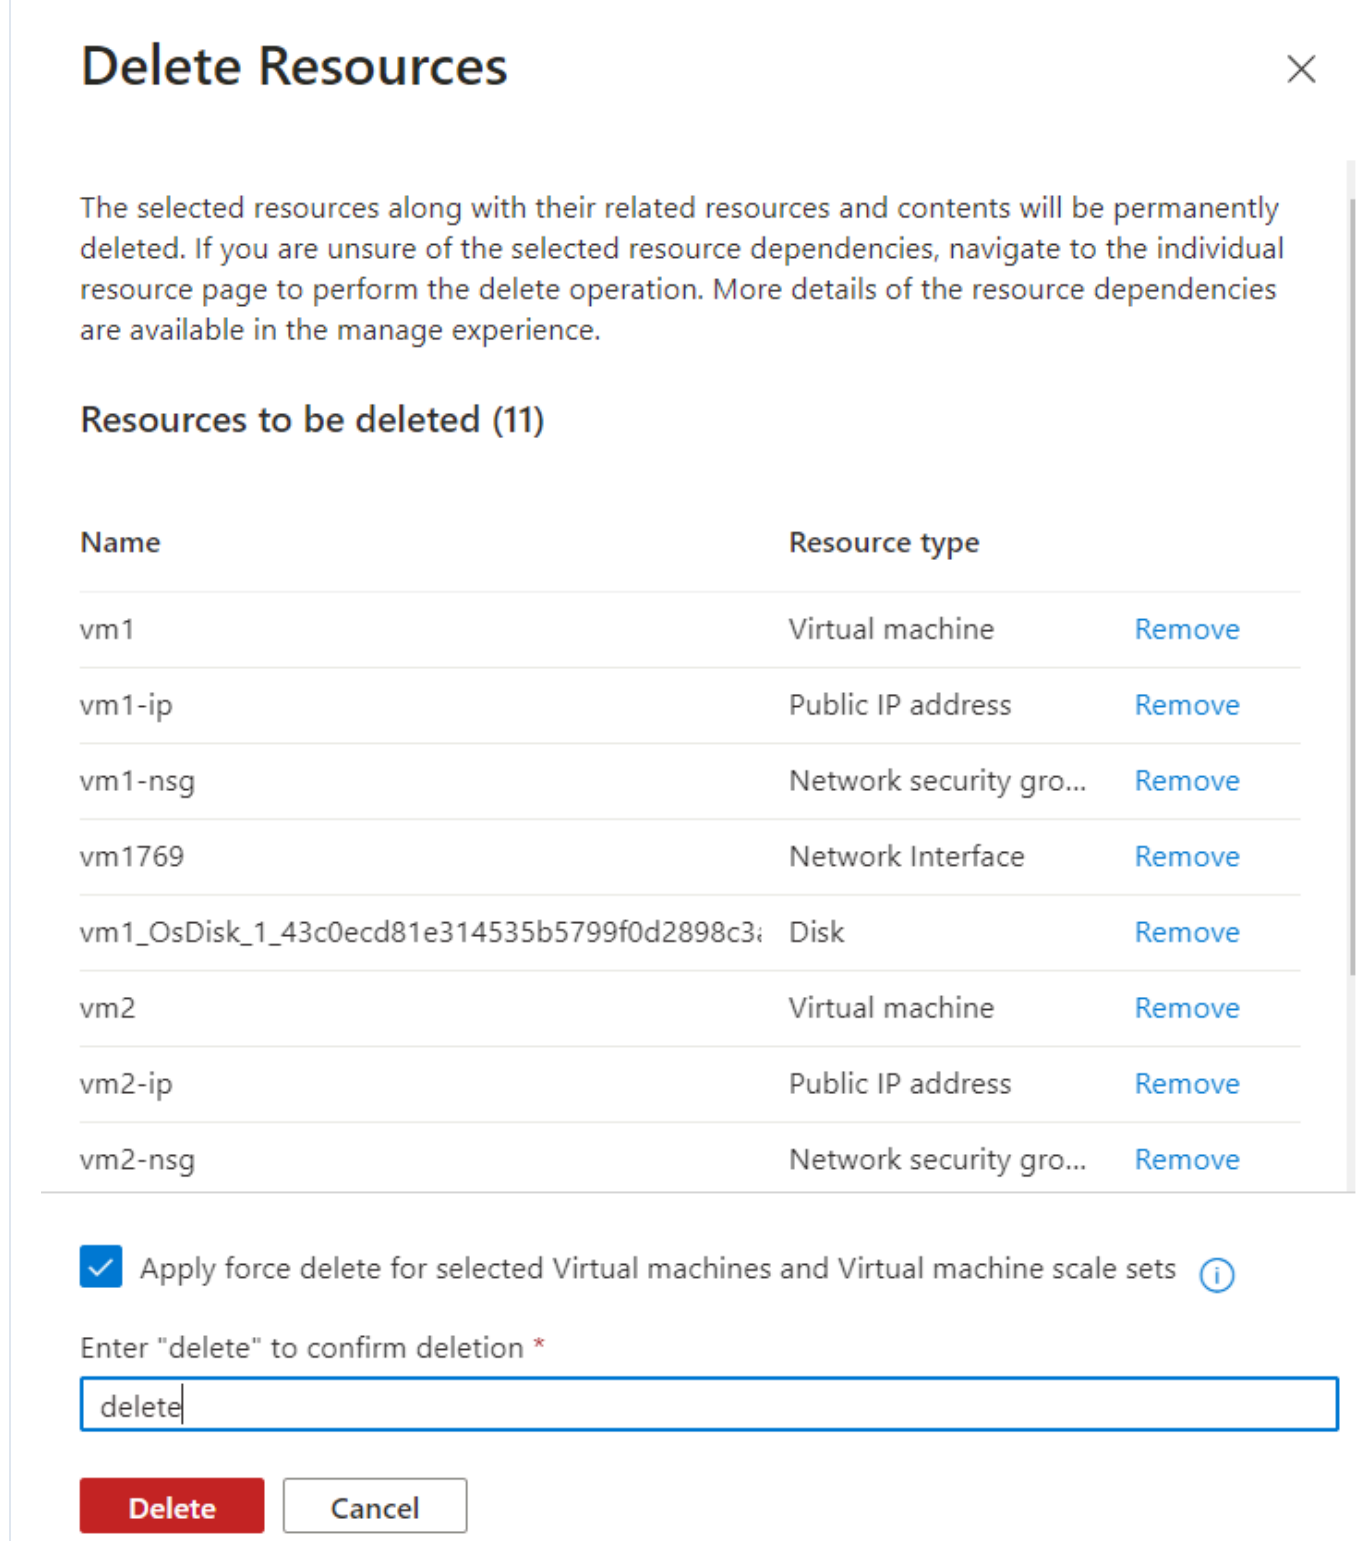

3. Select all the Resources in that **Resource groups.**

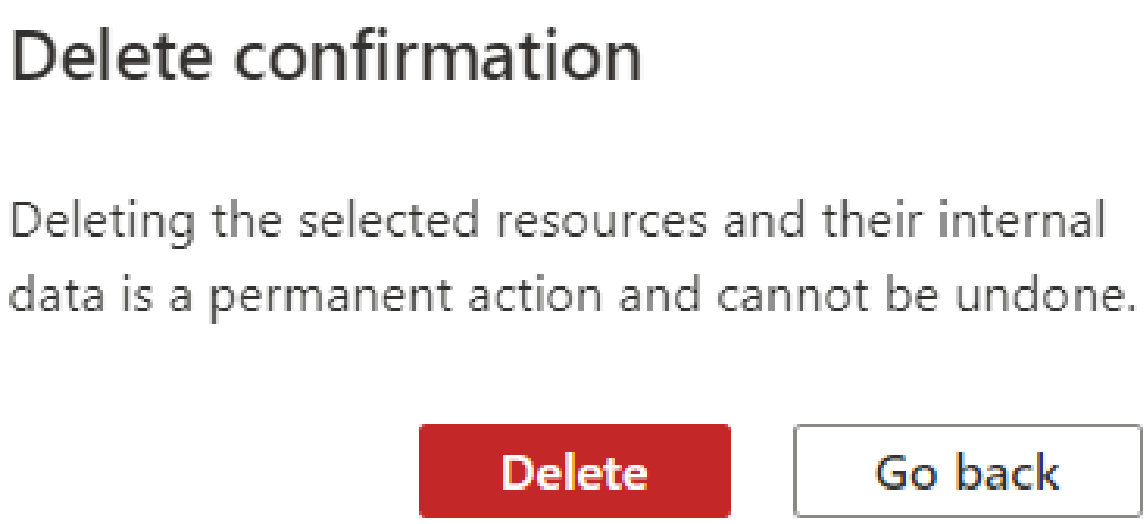

4. Go to three dots to the right and then click **Delete** button.

5. Now type **delete** in the box present at the bottom.

6. Click on **Delete** to confirm deletion of resources.

Completion and Conclusions

1. You have successfully signed into Azure Portal.
2. You have successfully created a virtual network.
3. You have successfully created virtual machines.
4. You have successfully tested the connection.
5. You have successfully tested the validation.
6. You have successfully deleted the resources.

End Lab

1. You have successfully completed this lab.
2. Click on **Sign out** in Azure Portal by clicking on the logout button in the top right corner inside Azure Profile.
3. Click on **End Lab** once you have completed the Lab.
